Foreword

This Technical Report has been produced by the 3rd Generation Partnership Project (3GPP).

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

1 Scope

The present document is a temporary container for the functional models, flows and protocol details for the presence service within the IP Multimedia (IM) Core Network (CN) subsystem based on the Session Initiation Protocol (SIP) and SIP Events.

Where possible the present document specifies the requirements for this protocol by reference to specifications produced by the IETF within the scope of SIP and SIP Events. Where this is not possible, extensions to SIP are defined within the present document. The document has therefore been structured in order to allow both forms of specification.

The present document includes information applicable to network operators, service providers and manufacturers.

Editor's note: Agreed material is held in this TR for an interim period of time. This has the advantage that:

It creates a location where the material may stabilise outside a document under CR control, thus fulfilling the function of the original annexes in the IN CN subsystem documents.

This TR will not be published.

2 References

[12]

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document in the same Release as the present document.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purposes of the present document, the terms and definitions defined in 3GPP TS 21.905 [1] and the following apply:

Subscription authorisation policy: a policy that determines which watchers are allowed to subscribe to a presentity's presence information. The subscription authorisation policy also determines to which presence tuples of the presentity's presence information the watcher has access.

For the purposes of the present document, the following terms and definitions given in 3GPP TR 23.141 [4] apply:

Presence list server Presence Network Agent (PNA) Presence Server (PS) Presence User Agent (PUA)

For the purposes of the present document, the following terms and definitions from RFC 2778 [15] apply:

Presence tuple Presentity

For the purposes of the present document, the following terms and definitions from draft-ietf-sip-publish-03 [22] apply:

Ewent Publication Agent (EPA) Ewent State Compositor (ESC)

For the purposes of the present document, the following terms and definitions from draft-ietf-simple-event-list-04 [21] apply:

Resource List Server (RLS)

For the purposes of the present document, the following terms and definitions given in RFC 1594 [11].

Fully-Qualified Domain Name (FQDN)

For the purposes of the present document, the following terms and definitions given in RFC 3261 [16] apply (unless otherwise specified see clause 6).

Final response
Header
Header field
Method
Request
Response
(SIP) transaction
Status-code (see RFC 3261 [16] subclause 7.2)
Tag (see RFC 3261 [16] subclause 19.3)

For the purposes of the present document, the following terms and definitions given in 3GPP TS 23.002 [3] subclause 4.1.1.1 and subclause 4a.7 apply:

Call Session Control Function (CSCF) Home Subscriber Server (HSS)

For the purposes of the present document, the following terms and definitions given in 3GPP TS 23.218 [5] subclause 3.1 apply:

Filter criteria Initial filter criteria Subsequent request

For the purposes of the present document, the following terms and definitions given in 3GPP TS 23.228 [6] subclause 4.3.3.1 and subclause 4.6 apply:

Interrogating-CSCF (I-CSCF) Proxy-CSCF (P-CSCF) Serving-CSCF (S-CSCF)

For the purposes of the present document, the following terms and definitions given in 3GPP TR 21.905 [1] apply:

User Equipment (UE)

For the purposes of the present document, the following terms and definitions from 3GPP TS 33.141 [10] apply:

Authentication Proxy

3.2 Abbreviations

For the purposes of the present document, the abbreviations in 3GPP TS 21.905 [1] and 3GPP TS 22.141 [2] and the following apply:

AUID Application Usage ID

CN Core Network

CSCF Call Session Control Function

CPIM Common Profile for Instant Messaging

DM Data Manipulator

DMS Data Manipulation Server
EPA Event Publication Agent
ESC Event State Compositor

XCAP XML Configuration Access Protocol
XML eXtensible Markup Language

4 Presence service overview

The presence service provides the ability for the home network to manage presence information of a user's device, service or service media even whilst roaming. A user's presence information may be obtained through input from the user, information supplied by network entities or information supplied by elements external to the home network. Consumers of presence information, watchers, may be internal or external to the home network. The architecture for the 3GPP presence service is specified in 3GPP TS 23.141 [4].

5 SIP related procedures

5.1 Introduction

5.2 Functional entities

5.2.1 User Equipment (UE)

A UE shall implement the role of a PUA (see subclause 5.3.1), a watcher (see subclause 5.3.2) or both.

5.2.2 Application Server (AS)

An application server may implement either of the roles of a PUA (see subclause 5.3.1), Watcher (see subclause 5.3.2), PS (see subclause 5.3.3), RLS (see subclause 5.3.4), or PNA.

For this version of the document, the interface between the PNA and the PS is not defined.

5.3 Roles

5.3.1 Presence User Agent (PUA)

5.3.1.1 General

A PUA is an entity that provides presence information to a PS.

In addition to the procedures specified in subclause 5.3.1, the PUA shall support the procedures specified in 3GPP TS 24.229 [8] appropriate to the functional entity in which the PUA is implemented.

Editor's Note: There is a need for a mechanism to let the IMS network and/or PS control the rate at which PUAs generate PUBLISH requests. Unless referenced IETF specifications provide support for implementation of this kind of control, such a mechanism or guidance on max rates must be identified and described here.

5.3.1.2 Publication of presence information

When the PUA intends to publish its own view of the presentity's presence information it shall generate a PUBLISH request by acting as an Event Publication Agent (EPA) in accordance with draft-ietf-sip-publish-03 [22].

The PUA shall implement the "application/pidf+xml" content type as described in draft-ietf-impp-cpim-pidf-08 [20] together with the Presence Information Data Format (PIDF) extensions defined in draft-ietf-simple-rpid-03 [25].

The PUA may implement the PIDF extensions defined in draft-ietf-simple-cipid-01 [31].

The PUA may implement location information according to the format defined in draft-ietf-geopriv-pidf-lo-01 [36].

NOTE 1 The categorisation of presence attributes to generic information attributes and communication address specific attributes is done using the <contact-type> element. The value of the <contact-type> element categorises the content of the tuple in such a way that the value "presentity" denotes general information about the presentity and the value "service" denotes the communication mean specific information. The presence document consists of one or more tuples describing the presentity related information and one or more tuples describing information about different communication means.

The eXtensible Markup Language (XML) Schema Definition of the "application/pidf+xml" format or the "application/pidf-partial+xml" format cover the definition of the 3GPP subscriber's presence attributes and the PUA shall perform the following mapping:

- the communication address (containing communication means, status and contact address) attribute and the priority attribute are represented by a <tuple> element including a basic <status> element and one or more <contact> elements containing a priority attribute as defined in draft-ietf-impp-cpim-pidf-08 [20].

The PUA represents the subscriber's status by including a <contact-type> element defined in draft-ietf-simple-rpid-03 [25] with the value "presentity" and a basic <status> element defined in draft-ietf-impp-cpim-pidf-08 [20]. In order to express more granularity in values, <activity> and <privacy> elements both defined in draft-ietf-simple-rpid-03 [25] can be used inside the <status> elements. Further PIDF extensions as defined in draft-ietf-simple-cipid-01 [31] can also be used.

In case of including multiple presentity related tuples in the presence document, all the presentity related tuples except one contains information about an alternate contact related to the presentity; the type of the alternate contact shall be indicated using the <relationship> element defined in draft-ietf-simple-rpid-03 [25];

NOTE 2: draft-ietf-simple-rpid-03 [25] defines also other values of the <contact-type> element. Those values can be used to create additional categories.

- the text attribute is represented by the <note> element as defined in draft-ietf-impp-cpim-pidf-08 [11]; and
- the location attribute is represented by the elements defined in draft-ietf-geopriv-pidf-lo-01 [36] and the <placetype> element defined in draft-ietf-simple-rpid-03 [25].

NOTE 3: Only information elements relevant for the application is included in the PUBLISH request. Attributes not relevant or available (e.g. the text attribute or the location attribute) are omitted.

Additional extensions can be used to express application specific attributes, but their usage is outside the scope of this version of the specification.

The PUA shall implement draft-ietf-simple-prescaps-ext-00 [24] if it wants to make use of SIP user agent capabilities in the presence document. The extension may be used for describing the type of the service described by the presence tuple.

The PUA shall implement the "multipart/related" content type as described in RFC 2387 [13] if it wants to aggregate other Multipurpose Internet Mail Extensions (MIME) objects with the "application/pidf+xml" content type.

When a presence attribute has a value of a MIME object, the PUA shall either:

- a) publish the presence document and the MIME object utilising the "multipart/related" content-type in the PUBLISH request; or
- b) make use of content indirection.

When the PUA decides to use the content indirection mechanism for publishing an initial or modified value of a presence attribute the PUA shall follow the following procedure:

- a) either store the MIME object behind an HTTP URI on the PS or ensure that the MIME object and a HTTP URL pointing to that MIME object already exists on the PS;
- b) use the "multipart/related" content type as described in RFC 2387 [13] with the content indirection mechanism as specified in draft-ietf-sip-content-indirect-mech-03.txt [39] for the publication of presence information format as follows:
 - set a CID URI referencing to other MIME multipart body which contains the content indirection information as the value of the XML element whose value is delivered as an indirect content;
 - include the presence document of the format "application/pidf+xml" or "application/pidf-partial+xml" in the root of the body of the "multipart/related" content;
 - specify the part having information about the MIME object by using the "message/external-body" content type, defining the HTTP URI, versioning information and other information about the MIME object as described in draft-ietf-sip-content-indirect-mech-03.txt [39].

NOTE 1: The versioning information is used for determining whether or not the MIME object indirectly referenced by a URI has changed or not;

When storing a MIME object on the PS the PUA shall:

- a) construct as many HTTP URIs as many objects to be stored; and
- b) formulate every HTTP URI according to a predefined directory structure.
- NOTE 2: The PUA has the root directory for storing the MIME objects on the PS preconfigured.
- NOTE 3: The PUA needs to store the MIME objects on the PS behind the HTTP URI(s) created previously using standard HTTP procedures as defined in RFC 2616 [14].

The PUA may indicate its support for partial publishing by including the "application/pidf-partial+xml" content type as described in draft-ietf-simple-partial-pidf-format-00 [37]. The initial PUBLISH request shall contain the full publication, where the state attribute is set to value "full".

On successful response from the PS, the PUA in subsequent PUBLISH requests shall generate partial publications, where the state attribute is set to value "partial".

If the PUA receives a 415 (Unsupported Media Type) response to the PUBLISH request with "application/pidf+xml" in the Accept header field, the PUA shall send a PUBLISH request including the "application/pidf+xml".cont ent type.

Editor's Note: The above procedures on partial publishing will be replaced by references to the IETF draft-lonnfors-simple-publish-partial-00 once the draft has been discussed in IETF.

The PUA shall update the presence information, either 600 seconds before the publication expiration time if the publication period indicated from the PS in the response to the PUBLISH request was for greater than 1200 seconds, or when half of the time has expired if the publication period was for 1200 seconds or less, unless the UE has determined that an update to the presence information is not required.

When the PUA intends to show different value of the same presence attribute to different watchers, the PUA shall publish a tuple for every value it intends to show, all including a different value of the same presence attribute. The PUA shall label different information with different value of the <class> element in every published tuple as defined in draft-ietf-simple-rp id-03 [25]. The PUA shall also authorize different tuples to different watchers or watcher groups by manipulating the subscription authorisation policy as defined in subclause 6.3.1.2.

5.3.1.3 Subscription for the watcher information event template package

Upon activation of the presence service, the PUA application shall subscribe for the watcher information state changes in accordance with draft-ietf-simple-winfo-package-05 [27] and draft-ietf-simple-winfo-format-04 [28].

The PUA application may include filters in the body of the SUBSCRIBE request in accordance with draft-ietf-simple-filter-format-00 [29] and draft-ietf-simple-filter-funct-00 [30].

5.3.1.4 Subscription for the xcap-change package

In order to get notifications of changes to XML documents manipulated via the Ut reference point the PUA may generate a SUBSCRIBE request in accordance with draft-ietf-simple-xcap-package-01 [33].

5.3.2 Watcher

5.3.2.1 General

A watcher is an entity that is subscribed or requests presence information about a presentity from the PS.

In addition to the procedures specified in subclause 5.3.2, the watcher shall support the procedures specified in 3GPP TS 24.229 [8] appropriate to the functional entity in which the watcher is implemented.

5.3.2.2 Subscription for presence information state changes and notification acceptance

When the watcher application intends to subscribe for presence information state changes of a presentity, it shall generate a SUBSCRIBE request in accordance with RFC 3265 [18] and draft-ietf-simple-presence-10 [26].

The watcher application shall implement the "application/pidf+xml" content type as described in draft-ietf-impp-cpim-pidf-08 [20] together with the PIDF extensions defined in draft-ietf-simpl-rpid-03 [25].

The watcher application may implement the PIDF extensions defined in draft-ietf-simple-cipid-01 [31].

The watcher application shall implement draft-ietf-simple- prescaps-ext-00 [24] in order to be able to understand SIP user agent capabilities extensions included in the presence document. The extension may be used by the watcher application for interpreting the type of the service described by the presence tuple. The watcher application may include filters in the body of the SUBSCRIBE request in accordance with draft-ietf-simple-filter-format-00 [29] and draft-ietf-simple-event-filter-funct-00 [30].

The watcher application may indicate its support for partial notification using the Accept header field in accordance with draft-ietf-simple-partial-notify-01 [23].

The watcher application shall interpret the received presence information according to the following:

- a) a tuple including a <contact-type> element as defined in draft-ietf-simple-rpid-03 [25] with the value "presentity" means general information about the presentity;
- b) a tuple including a <relationship> element and <contact-type> element with the value "presentity" as defined in draft-ietf-simple-rpid-03 [25] means information about an alternate contact to the presentity;
- c) a tuple including a <contact-type> element as defined in draft-ietf-simple-rpid-03 [25] with the value "service" means communication mean specific information. The communication mean described by the tuple is deduced from the URI scheme of the contact address information present in the <contact> element as defined in draft-ietf-impp-cpim-pidf-08 [20]. If the URI scheme of the contact address information provides ambiguous information about the communication means, the watcher application shall further examine other elements of the tuple to decide the communication mean. Such elements can be the <methods> element, any of the different media type specific elements as defined in draft-ietf-simple-prescaps-ext-00 [24], or the <relationship> element as defined in draft-ietf-simple-rpid-03 [25].

Additional extensions can be used to express application specific attributes, but their usage is outside the scope of this version of the specification.

5.3.2.3 Subscription for presence information state changes of presentity collections

When the watcher application intends to subscribe for presence information state changes of a presentity collection, it shall generate a SUBSCRIBE request in accordance with draft-ietf-simple-event-list-04 [21], additionally to the procedures described in subclause 5.3.2.2.

5.3.2.4 Subscription for the watcher information event template package

Upon activation of the presence service, the watcher application may subscribe recursively for the watcher information state changes in accordance with draft-ietf-simple-winfo-package-05 [27] and draft-ietf-simple-winfo-format-04 [28].

The watcher application may include filters in the body of the SUBSCRIBE request in accordance with draft-ietf-simple-filter-format-00 [29] and draft-ietf-simple-event-filter-funct-00 [30].

5.3.2.5 Subscription for the xcap-change package

In order to get notifications of changes to XML documents manipulated via the Ut reference point the watcher may generate a SUBSCRIBE request in accordance with draft-ietf-simple-xcap-package-01 [33].

5.3.3 Presence Server (PS)

5.3.3.1 General

A PS is an entity that accepts, stores, and distributes presence information.

In addition to the procedures specified in subclause 5.3.3, the PS shall support the procedures specified in 3GPP TS 24.229 [8] appropriate to the functional entity in which the PS is implemented.

5.3.3.2 Subscription acceptance to presence information and notification of state changes

When the PS receives a SUBSCRIBE request for the presence information event package, the PS shall first attempt to verify the identity of the source of the SUBSCRIBE request as described in subclause 8.1, then perform authorization according to subclause 8.2. In case of successful subscription, the PS shall generate a response to the SUBSCRIBE request and notifications in accordance with RFC 3265 [18] and draft-ietf-simple-presence-10 [26].

Additionally, in the special case of a watcher subscription if the subscription authorization policy results in the action to confirm the watcher subscription from the PUA and the PUA has a valid watcher information subscription, see draft-ietf-simple-winfo-package-05 [27], then, the PS shall inform the PUA about the watcher subscription attempt.

If the watcher application has indicated the need for partial notification using the Accept header field, then the PS shall generate partial notifications in accordance with draft-ietf-simple-partial-notify-01 [23] and draft-ietf-simple-partial-pidf-format-00 [37].

If the body of the SUBSCRIBE request from the watcher contains filters, the PS shall apply the requested filtering function on notifications in accordance with draft-ietf-simple-filter-format-00 [29] and draft-ietf-simple-event-filter-funct-00 [30].

If the watcher application has indicated support for the "multipart/related" content type using the Accept header field, then the PS may generate notifications using "multipart/related" content type which aggregates "application/pidf+xml" formatted presence information with MIME objects in accordance with RFC 2387 [13]. In this case, the PS shall modify the value of the presence attribute in the PIDF document to refer to the MIME object included in the corresponding MIME multipart body. If the watcher application has not indicated support for the "multipart/related" or a MIME object cannot be accessed by the PS, the PS should exclude the presence attribute from the notification.

5.3.3.3 Publication acceptance of presence information

The PS shall act as an Event State Compositor (ESC).

When the PS receives a PUBLISH request, the PS shall first verify the identity of the source of the PUBLISH request as described in subclause 8.1, then perform authorization according to subclause 8.2. In case of successful authentication and authorization, the PS shall process the PUBLISH request in accordance with draft-ietf-sip-publish-03 [22].

If the PUBLISH request indicated support for partial publishing using the "application/pidf-partial+xml" content-type described in draft-ietf-simple-partial-pidf-format-00 [37] and if the PS supports partial publishing, the PS shall process the PUBLISH request in accordance with draft-ietf-sip-publish-03 [22]. If the PS does not support partial publishing, then the PS shall send a 415 (Unsupported Media Type) response with "application/pidf+xml" in the Accept header field.

Editor's Note: The above procedures on partial publishing will be replaced by references to the IETF draft-lonnfors-simple-publish-partial-00 once the draft has been discussed in IETF.

If the PUBLISH request contained the "multipart/related" content type and the PS supports the content type, the PS shall process the content as follows:

- if a MIME multipart contains a MIME object of a content type supported by the PS, the PS shall either store the MIME object in case of initial publication or replace an existing content in case of modify operation;
- if a multipart includes the "message/external-body" content type and the content indirection is supported by the PS, the PS shall ensure that it has access to the MIME object indicated by the URI and that the MIME object is existing; and
- associate the value of the presence attribute referring to one of the MIME multiparts with the MIME object and additional information about it.

If the PS does not support the content type used for publishing MIME objects then the PS shall send a 415 (Unsupported Media Type) response and indicate the supported content types in the Accept header.

NOTE: If the PS receives a HTTP request for storing a MIME object on the PS meaning that the HTTP URI points to a predefined directory reserved for storing MIME objects and the request is an HTTP PUT request, the PS replaces any existing content referenced by the Request-URI with the content of the request. If the Request-URI points to an uncreated directory, the PS creates the directory, stores the content there and associates the content with the Request-URI. For all requests, i.e HTTP PUT, HTTP GET and HTTP DELETE requests, the PS generates an appropriate response in accordance with RFC 2616 [14].

5.3.3.4 Subscription acceptance to watcher information and notification of state changes

When the PS receives a SUBCRIBE request for the watcher information event template package, the PS shall first verify the identity of the source of the SUBSCRIBE request as described in subclause 8.1, then perform authorization according to subclause 8.2. In case of successful subscription, the PS shall generate a response to the SUBSCRIBE request and notifications in accordance with RFC 3265 [18], draft-ietf-simple-winfo-package-05 [27] and draft-ietf-simple-winfo-format-04 [28].

If the body of the SUBSCRIBE request from the PUA contains filters, the PS shall apply the requested filtering function on notifications in accordance with draft-ietf-simple-filter-format-00 [29] and draft-ietf-simple-event-filter-funct-00 [30].

5.3.3.5 Subscription acceptance to xcap-change and notification of state changes

When the PS receives a SUBSCRIBE request having the Event header value 'xcap-change', the PS shall first verify the identity of the source of the SUBSCRIBE request as described in subclause 8.1, then it shall perform authorization as described in subclause 8.2. Afterwards, the PS shall generate a response to the SUBSCRIBE request and notifications in accordance with draft-ietf-simple-xcap-package-01 [33].

5.3.4 Resource List Server (RLS)

5.3.4.1 General

The Resource List Server (RLS) is an implementation of the presence list server. The RLS is an entity that accepts subscriptions to resource lists and sends notifications to update subscribers of the state of the resources in a resource list.

In addition to the procedures specified in subclause 5.3.4, the RLS shall support the procedures specified in 3GPP TS 24.229 [8] appropriate for an AS in which the RLS is implemented.

5.3.4.2 Subscription acceptance to resource lists and notification of state changes

When the RLS receives a SUBSCRIBE request for the presence information event package of a presentity collection, the RLS shall first verify the identity of the source of the SUBSCRIBE request as described in subclause 8.1, then perform authorization according to subclause 8.2. In case of successful subscription, the RLS shall generate a response to the SUBSCRIBE request and notifications in accordance with draft-ietf-simple-event-list-04 [21] by adding a Require header field with value 'eventlist' to the request.

If the body of the SUBSCRIBE request from the watcher contains filters, the RLS shall apply the requested filtering function on notifications in accordance with draft-ietf-simple-filter-format-00 [29] and draft-ietf-simple-event-filter-funct-00 [30].

5.3.4.3 Subscription to presence information

When the RLS receives a SUBSCRIBE request for the presence information event package of a presentity collection and installs the corresponding subscription, the RLS shall resolve the list URI to individual URIs and generate SUBSCRIBE requests for each of the individual URIs as per the procedures in RFC 3265 [18], draft-ietf-simple-presence-10 [26] and draft-ietf-simple-event-list-04 [21] if the state information for the resource represented by the individual URI is otherwise not available.

Editor's note: There is a need for a mechanism that can protect an IMS network from list loops potentially caused by lists of lists. Unless referenced IETF specifications provide support for implementation of this kind of protection, a mechanism or restrictions on the usage of list of lists must be identified and described here.

5.3.4.4 Subscription acceptance to xcap-change and notification of state changes

When the RLS receives a SUBSCRIBE request having the Event header value 'xcap-change', the RLS shall first verify the identity of the source of the SUBSCRIBE request as described in subclause 8.1, then it shall perform authorization as described in subclause 8.2. Afterwards, the RLS shall generate a response to the SUBSCRIBE request and notifications in accordance with draft-ietf-simple-xcap-package-01 [33].

5.4 Presence Network Agent (PNA)

5.4.1 General

For this version of the document, the interface between the PNA and the PS is not defined.

In addition to the procedures specified in subclause 5.4, the PNA shall support the procedures specified in 3GPP TS 24.229 [8] appropriate to the functional entity in which the PNA is implemented.

The PNA can collect presence information about the presentity from a number of core network entities. The PNA can combine information from various core network entities to form more complete presence information.

Among these core network entities, the S-CSCF uses SIP to deliver presence information to the PNA over the Pi reference point as follows.

NOTE:

As part of the configuration of AS to provide a presence system, appropriate settings are downloaded to the initial filter criteria in the S-CSCF to ensure this occurs. The PNA will receive third-party REGISTER requests as specified in 3GPP TS 24.229 [8] subclause 5.4.1.7 and subclause 5.7.1.1.

5.4.2 Subscription to reg event package

On receiving a third-party REGISTER request which contains an Expires header with a non-zero value, the PNA shall, if no subscription already exists, subscribe to the reg event package for a particular user at the S-CSCF, as described in 3GPP TS 24.229 [8] subclause 5.7.1.1. As a result, the S-CSCF will then provide the presence-related information as reg event packages in NOTIFY requests to the PNA.

On receiving a third-party REGISTER request, the PNA may, if a subscription already exists, resubscribe to the reg event package for a particular user at the S-CSCF, as described in 3GPP TS 24.229 [8] subclause 5.7.1.1. As a result, the S-CSCF will then provide the presence-related information as reg event packages in NOTIFY requests to the PNA.

6 Protocol for data manipulation at the Ut reference point

6.1 Introduction

Hypertext Transfer Protocol (HTTP) and XML Configuration Access Protocol (XCAP) are used to store, alter and delete data related to the presence service. The general information that can be manipulated is user groups, subscription authorization policy, resource lists, hard state presence publication, MIME objects referenced from the hard state presence information, etc. Soft state presence information manipulated with a PUBLISH request is not manipulated by the mechanism provided over the Ut reference point.

6.2 Functional entities

6.2.1 User Equipment (UE)

The UE implements the Data Manipulator (DM) role as described in subclause 6.3.1.

The UE shall implement HTTP digest AKA (see RFC 3310 [19]) and it shall initiate a bootstrapping procedure with the bootstrapping server function located in the home network, as described in 3GPP TS 24.109 [7].

The UE shall acquire the subscriber's certificate from PKI portal by using a bootstrapping procedure, as described in 3GPP TS 24.109 [7].

The UE and the authentication proxy shall both implement TLS (see RFC 2246 [12]). The UE shall be able to authenticate the authentication proxy based on the received certificate during TLS handshaking phase.

6.2.2 Application Server (AS)

If an AS implements the role of a PS (see subclause 5.3.3) or of a RLS (see subclause 5.3.4), then the AS shall also implement the role of a Data Manipulation Server (DMS) (see subclause 6.3.2).

If there is no authentication proxy in the network, then the AS shall also implement the role of a network application function, as described in 3GPP TS 24.109 [7] and it shall support HTTP digest authentication and certificate authentication.

Editor's note: It needs to be clarified what physical entities can contain the Authentication Proxy and its relationship with the IMS architecture.

6.2.3 Authentication proxy

The authentication proxy shall implement the role of a network application function, as described in 3GPP TS 24.109 [7] and it shall support HTTP Digest Authentication and certificate authentication.

The Authentication Proxy shall authenticate the UE and integrity protect the messages sent towards the UE.

Editor's note: It is FFS how the Authentication Proxy passes the user's identity to the Application Server (AS).

6.3 Roles

6.3.1 Data Manipulator (DM)

6.3.1.1 Introduction

The DM is a logical function that provides the means to manipulate the general data such us user groups, subscription authorization policy, resource lists, hard state presence publication, MIME objects referenced from the hard state presence information, etc.

NOTE: In order to be able to manipulate data stored on the DMS, the DM has the root directory on the DMS preconfigured or use some means to discover it. Discovery mechanisms are outside the scope of this specification.

6.3.1.2 Manipulating a presencelist

When the DM intends to manipulate a presencelist, it shall generate an HTTP PUT, GET or DELETE request in accordance with RFC 2616 [14], draft-ietf-simple-xcap-02 [32] and draft-ietf-simple-xcap-list-usage-02 [35].

6.3.1.3 Manipulating the subscription authorisation policy

When the DM intends to manipulate the subscription authorization policy, it shall generate an HTTP PUT, HTTP GET or HTTP DELETE request in accordance with RFC 2616 [14], draft-ietf-simple-xcap-02 [32] and draft-ietf-simple-presence-rules-00 [34].

When the DM intends to authorize a different value of the same presence attribute to different watchers or watcher groups, the DM shall authorize a single tuple including one of the different values of the same presence attribute to every watcher or watcher groups by using a specific "inclusion set" as specified in draft-ietf-simple-presence-rules-00 [34].

6.3.1.4 Publishing hard state presence information

The DM shall implement draft-isomaki-simple-xcap-pidf-manipulation-usage-00 [33] in order to be able to manipulate hard state presence information. Hard state presence information uses the same format as soft state information, namely "application/pidf+xml" content type as described in draft-ietf-impp-cpim-pidf-08 [20] together with any of its extensions.

When the hard state presence information contains one ore more MIME objects to be aggregated with the "application/pidf+xml" content type and any of its extensions, the DM shall:

a) construct as many HTTP URIs as many objects to be stored and formulate every HTTP URI according a predefined directory structure

8 Identified material for 3GPP documents other than

NOTE: In order to be able to manipulate data stored on the DMS, the DM has the root directory on the DMS preconfigured or use some means to discover it. Discovery mechanisms are outside the scope of this specification.

- b) store the objects on the data manipulation server behind the HTTP URI(s) created in the previous step using standard HTTP procedures as defined in RFC 2616 [14];
- c) include every HTTP URI as a value of the corresponding XML element in the published "application/pidf+xml" presence document referencing the stored object(s) in the previous step; and
- d) publish the hard state presence information according to draft-isomaki-simple-xcap-pidf-manipulation-usage-00 [33].

6.3.2 Data Manipulation Server (DMS)

6.3.2.1 Introduction

The Data Manipulation Server (DMS) is a logical function which can store data such us user groups, subscription authorization policy, resource lists, hard state presence information, MIME objects referenced from the hard state presence information, etc.

6.3.2.2 Resource list manipulation acceptance

When the data manipulation server receives an HTTP PUT, HTTP GET or HTTP DELETE request for manipulating or fetching a resource list, the DMS shall first authenticate the request in accordance with 3GPP TS 24.109 [7] and then perform authorization. Afterwards the DMS shall perform the requested action and generate a response in accordance with RFC 2616 [14], draft-ietf-simple-xcap-02 [32] and draft-ietf-simple-xcap-list-usage-02 [35].

6.3.2.3 Subscription authorization policy manipulation acceptance

When the DMS receives an HTTP PUT, HTTP GET or HTTP DELETE request for manipulating or fetching of the subscription authorization policy, the data manipulation server shall first authenticate the request in accordance with 3GPP TS 24.109 [7] and then perform authorization. Afterwards the DMS shall perform the requested action and generate a response in accordance with RFC 2616 [14], draft-ietf-simple-xcap-02 [32] and draft-ietf-simple-xcap-presence-rules-00 [34].

6.3.2.4 Publication acceptance of hard state presence information

When the DMS receives an HTTP PUT, HTTP GET or HTTP DELETE request for publishing, fetching or deleting of hard state presence information, the DMS shall first authenticate the request in accordance with 3GPP TS 24.109 [7] and then perform authorization. Afterwards the DMS shall:

- a) if the HTTP URI points to a predefined directory reserved for storing MIME objects and the request is an HTTP PUT request, replace any existing content referenced by the Request-URI with the content of the request. If the Request-URI points to an uncreated directory, create the directory, store the content there and associate the content with the Request-URI. For all requests, i.e HTTP PUT, HTTP GET and HTTP DELETE requests, generate an appropriate response in accordance with RFC 2616 [14]; or
- c) if the HTTP URI points to an XCAP directory and the Application Usage ID (AUID) part of the HTTP URI is set to 'pidf-manipulation', process the request and generate an appropriate response in accordance with draft-ietf-simple-xcap-02 [32], draft-isomaki-simple-xcap-pidf-manipulation-usage-00 [33] and RFC 2616 [14].

7 Presence information model of the 3GPP subscriber

Editor's Note: this clause describes 3GPP extensions to CPIM-PIDF defining the 3GPP subscriber presence attributes.

8.1 User identify verification at the AS

The procedures at the AS to accomplish user identity verification are described with the help of figure 8.1-1.

When the AS receives a SIP initial or standalone request that does not contain credentials, the AS shall:

Editor's Note: it is not clear what are the mechanisms available to transport the credentials. These mechanisms can include, among others, P-Asserted-Identity, Authorization header, digital signatures, S/MIME body, etc.

- a) if a Privacy header is present in the initial or standalone request and the Privacy header value is set to "id" or "user", then the user and the request are considered as anonymous, and no further actions are required. The AS shall consider the request as authenticated;
- b) if there is no Privacy header present in the initial or standalone request, or if the Privacy header contains a value other than "id" or "user", then the AS shall check for the presence of a P-Asserted-Identity header in the initial or standalone request. Two cases exists:
 - i) the initial or standalone request contains a P-Asserted-Identity header. This is typically the case when the user is located inside a trusted domain as defined by 3GPP TS 24.229 [8] subclause 4.4. In this case, the AS is aware of the identity of the user and no extra actions are needed. The AS shall consider the request as authenticated.
 - ii) the initial or standalone request does not contain a P-Asserted-Identity header. This is typically the case when the user is located outside a trusted domain as defined by 3GPP TS 24.229 [8] subclause 4.4. In this case, the AS does not have a verified identity of the user. The AS shall check the From header of the initial or standalone request. If the From header value in the SUBSCRIBE request is set to "Anonymous", then the user and the request are considered as anonymous and no further actions are required. If the From header value does not indicate anonymity, then the AS shall challenge the user by issuing a 401 (Unauthorized) response including a challenge as per procedures described in RFC 3261 [8.26].

When the AS receives a SIP initial or standalone request that contains credentials but it does not contain a P-Asserted-Identity header the AS shall check the correctness of the credentials as follows:

- a) If the credentials are correct, then the AS shall consider the identity of the user verified, and the AS shall consider the request as authenticated;
- b) If the credentials are not correct, the AS may either rechallenge the user by issuing a 401 (Unauthorized) response including a challenge as per procedures described in RFC 3261 [8.26] (up to a predetermined maximum number of times predefined in the AS configuration data), or consider the user as anonymous. If the user is considered anonymous, the PS shall consider the request as authenticated.

Editor's Note: It needs to be investigated whether the maximum number of times predefined in the AS configuration data creates a potential denial of service attack, as it requires the AS to keep states between different different authentications trials.

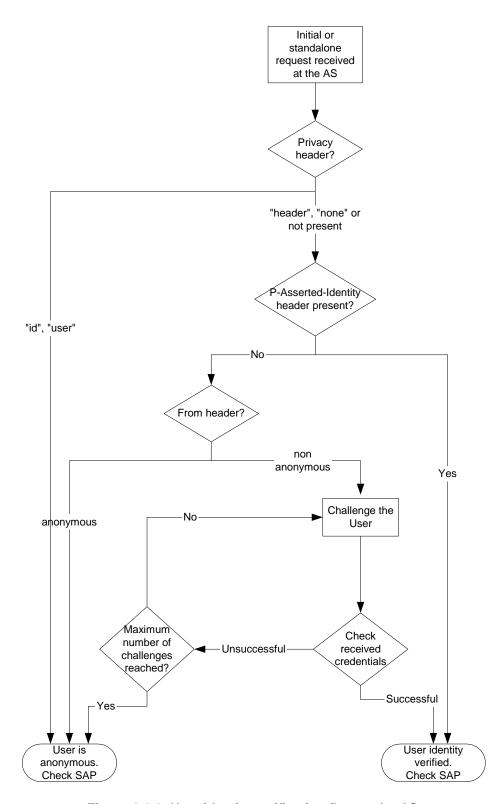

Figure 8.1-1: User identity verification flow at the AS

8.2 Request authorization

Once the AS have tried to verify the identity of the user, the AS either has a verified identity of the user or it considers the user as anonymous.

If the user is considered anonymous, the AS shall check whether the authorization policy defined for this request allows anonymous requests. If anonymous requests are allowed, then the AS can proceed with the requested functionality, otherwise, the AS shall not proceed with the requested functionality.

If the user is identified by an identity, the AS shall apply the authorization policy related to the requested functionality to detect whether the particular user is allowed to request the functionality. The authorization policy may require a verified identity of a user.

If the request is authorized then the AS shall continue with the procedures as defined for that request.

If the request is not authorized, the AS shall either:

- reject the request according to the procedures defined for that request e.g., by issuing a 403 (Forbidden) response; or
- send a 2xx final response if the authorization policy requires to deny the requested functionality, whilst appearing to the user as if the request has been granted.

8.3 Event notification throttling

If the user has indicated a preference for throttling of SIP event notifications using the parameters defined in draft-niemi-sipping-event-throttle-00 [8.72], then the AS shall generate notifications in accordance with the user's preference and possibly other policies (e.g., AS internal policy) applied to the case.

Editor's Note: draft-niemi-sipping-event-throttle-00 [8.72] is one solution for the requirement. If other solutions are identified, the text shall be updated to reflect the chosen solution.

8.4 Profiles of IETF RFCs for 3GPP usage

Editor's note: It is intended that material from this clause will be added to Annex A of TS 24.229.

A new table A.3A is added to subclause A.1.3 of 3GPP TS 24.229:

Table A.3A: Roles specific to additional capabilities

Item	Roles	Reference	RFC status	Profile status			
1	Presence server	3GPP TS 24.141	n/a	c1			
		[8.70]					
2	Presence user agent	3GPP TS 24.141	n/a	c2			
		[8.70]					
3	Resource list server	3GPP TS 24.141	n/a	c3			
		[8.70]					
4	Watcher	3GPP TS 24.141	n/a	c4			
		[8.70]					
c1:	IF A.3/7 A AND A.3/7B THEN o ELSE n/a	AS acting as terminat	ting UA, or redirect se	rver and AS acting			
	as originating UA.						
c2:	IF A.3/1 THEN o ELSE n/a UE.						
c3:	IF A.3/7 A THEN o ELSE n/a AS acting as	terminating UA, or re	direct server.				
c4:	IF A.3/1 OR A.3/7B THEN o ELSE n/a UE or AS acting as originating UA.						
	For the purposes of the present document it has been chosen to keep the specification simple by the tables						
	specifying only one role at a time. This does			o roles, but an			
	entirely separate assessment of the tables s	hall be made for each	role.				

Table A.4 of 3GPP TS 24.229 is modified with the following additional row:

	Extensions			
		F0 741		
XX	an event state publication extension to the session initiation protocol?	[8.71]	0	c30
c30:	IF (A.3 A/1 OR A.3 A/2 THEN m ELSE IF A.3 user agent, UE, AS.	/1 OR A.3/7 THEN o ELSE	n/a presence	e server, presence

Editor's note: Table A.4 also needs modification to A.4/22 and A.4/23 to indicate dependency on new table A.3A roles.

Table A.4A of 3GPP TS 24.229 is modified with the following additional rows:

- c1: IF A.4/20 THEN o ELSE n/a - SIP specific event notification extension.
- c2: IF A.4/20 THEN m ELSE n/a - SIP specific event notification extension.
- c3: IF A.4/7 THEN m ELSE n/a - authentication between UA and UA.
- c4: IF A.4/11 THEN o ELSE n/a - insertion of date in requests and responses.
- c5: IF A.4/8 A THEN m ELSE n/a - authentication between UA and proxy.
- c6: IF A.4/6 THEN o ELSE n/a - timestamping of requests.
- c7: IF A.3/1 AND A.4/25 THEN o ELSE n/a - ŪE and private extensions to the Session Initiation Protocol (SIP) for asserted identity within trusted networks.
- c8: IF A.4/38 THEN o ELSE n/a - the Reason header field for the session initiation protocol.
- c9: IF A.4/37 THEN o ELSE n/a - security mechanism agreement for the session initiation protocol (note 2).
- c10: IF A.4/37 THEN m ELSE n/a - security mechanism agreement for the session initiation protocol.
- c11: IF A.4/25 THEN o ELSE n/a - private extensions to the Session Initiation Protocol (SIP) for asserted identity within trusted networks.
- c12: IF A.4/26 THEN o ELSE n/a - a privacy mechanism for the Session Initiation Protocol (SIP).
- c13: IF A.4/32 THEN o ELSE n/a - the P-Called-Party-ID extension.
- c14: IF A.4/33 THEN o ELSE n/a - the P-Visited-Network-ID extension.
- c15: IF A.4/34 THEN o ELSE n/a - the P-Access-Network-Info header extension.
- c16: IF A.4/34 AND A.3/1 THEN m ELSE n/a - the P-Access-Network-Info header extension and UE.
- c17: IF A.4/34 AND (A.3/7 A OR A.3/7D) THEN m ELSE n/a - the P-Access-Network-Info header extension and AS acting as terminating UA or AS acting as third-party call controller.
- c18: IF A.4/36 THEN o ELSE n/a - the P-Charging-Vector header extension.
- c19: IF A.4/36 THEN m ELSE n/a - the P-Charging-Vector header extension.
- c20: IF A.4/35 THEN o ELSE n/a - the P-Charging-Function-Addresses header extension.
- c21: IF A.4/35 THEN m ELSE n/a - the P-Charging-Function-Addresses header extension.
- c22: IF A4/40 THEN o ELSE n/a - caller preferences for the session initiation protocol.
- c24: IF A.162/50 THEN m ELSE n/a - caller preferences for the session initiation protocol.
- NOTE 1: The strength of this requirement is RECOMMENDED rather than OPTIONAL.
- NOTE 2: Support of this header in this method is dependent on the security mechanism and the security architecture which is implemented.
- NOTE 3: The strength of this requirement in RFC 3455 [52] is SHOULD NOT, rather than MUST NOT.

Annex A:

Example signalling flows of presence service operation

A.1 Scope of signalling flows

This annex gives examples of signalling flows for the presence service within the IP Multimedia (IM) Core Network (CN) subsystem based on the Session Initiation Protocol (SIP) and SIP Events.

These signalling flows provide detailed signalling flows, which expand on the overview information flows provided in 3GPP TS 23.141 [4].

A.2 Introduction

A.2.1 General

The signalling flows provided in this annex follow the methodology developed in 3GPP TS 24.228 [7]. The following additional considerations apply:

- a) 3GPP TS 24.228 [7] shows separate signalling flows with no configuration hiding between networks, and with configuration hiding between networks. There is no presence specific functionality associated with this hiding, and therefore such separate signalling flows are not show in this document; and
- b) 3GPP TS 24.228 [7] does not show the functionality between the S-CSCF and the AS. As the presence service depends on the functionality provided by various AS, the signalling flows between S-CSCF and AS are shown in this document.

A.2.2 Key required to interpret signalling flows

The key to interpret signalling flows specified in 3GPP TS 24.228 [7] subclause 4.1 and subclause 4.2 applies with the additions specified below.

- rls.home 1.net: an RLS in the home network of the watcher;
- rls.home 2.net: an RLS in the home network of the service provider, but not the home network of the watcher;
- ps.home1.net: a PS in the home network of the publisher;
- ps.home2.net: a PS in the home network of the service provider, but not in that of the watcher;
- user1_list1@home1.net: a resource list being subscribed to on a RLS in the home network;
- user2_list1@home2.net: a resource list being subscribed to on a RLS in the home network of the service provider, but not the home network of the subscriber;
- user1_public1@home1.net: presentity being watched, own watcher list;
- user3_public1@home3.net: presentity being watched.

As in 3GPP TS 24.228 [7], in order to differentiate between SIP methods and other protocol messages, the message name is preceded with the associated protocol for all non-SIP messages. Where the XCAP is used to map an HTTP URI to an XML document, the protocol name "XCAP" is used for both the HTTP request and HTTP response.

Each signalling flow table contains descriptions for headers where the content of the header is new to that signalling flow, as is already performed in 3GPP TS 24.228 [7].

However, 3GPP TS 24.228 [7] includes extensive descriptions for the contents of various headers following each of the tables representing the contents of the signalling flows. Where the operation of the header is identical to that shown in 3GPP TS 24.228 [7], then such text is not reproduced in this document.

Additional text may also be found on the contents of headers within 3GPP TS 24.228 [7] in addition to the material shown in this document.

A.3 Signalling flows demonstrating how watchers subscribe to presence event notification

A.3.1 Introduction

The subclause covers the signalling flows that show how watchers can request presence information about a presentity.

For the routeing of the Public Service Identity (PSI) towards the AS, there are two scenarios:

Subclause A.3.3.2 shows the case where the I-CSCF forwards the SUBSCRIBE request directly to the RLS when the RLS is located within the same network. There is another scenario where the I-CSCF forwards the SUBSCRIBE request towards the RLS, being involved with the S-CSCF located in the same network, but this scenario is not described in this document.

A.3.2 Watcher and presentity in different networks, UE in home network

A.3.2.1 Successful subscription

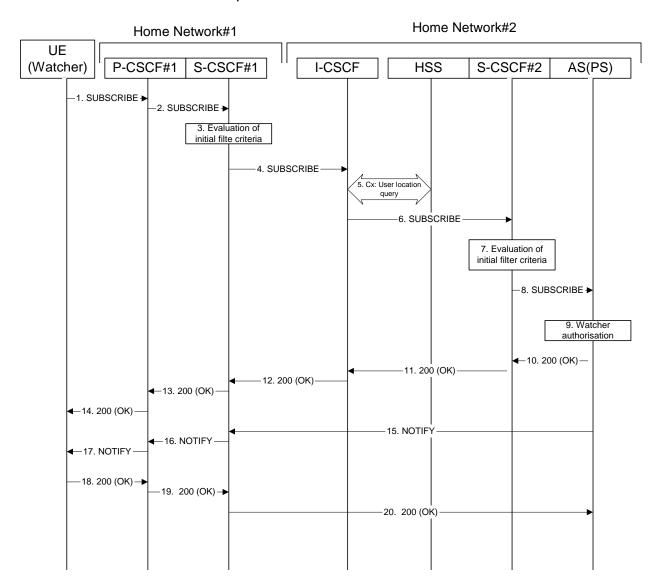

Figure A.3.2.1-1: Watcher subscribing for presence information

Figure A.3.2.1-1 shows a watcher subscribing to presence event notification about a presentity. The presentity is in a different IM CN subsystem. The details of the signalling flows are as follows:

1. SUBSCRIBE request (UE (watcher) to P-CSCF) – see example in table A.3.2.1-1

A watcher agent in a UE wishes to watch a presentity, or certain presence tuples of the presentity. To initiate a subscription, the UE generates a SUBSCRIBE request containing the 'presence' event that it wishes to be notified of, together with an indication of the length of time this periodic subscription should last and the support for partial notification.

Table A.3.2.1-1: SUBSCRIBE request (UE (watcher) to P-CSCF)

```
SUBSCRIBE sip:user2_public1@home2.net SIP/2.0
Via: SIP/2.0/UDP [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKnashds7
Max-Forwards: 70

Security-Verify: ipsec-3gpp; q=0.1; alg=hmac-sha-1-96; spi-c=98765432; spi-s=87654321; port-
      c=8642; port-s=7531
Event: presence
Expires: 7200
Accept: application/pidf+xml;q=0.3, application/pidf-partial+xml;q=1
Contact: <sip:[5555::aaa:bbb:ccc:ddd]:1357; comp=sigcomp>
Content-Length: 0
```

Request-URI: Public user identity whose events the subscriber subscribes to.

Event: This field is populated with the value 'presence' to specify the use of the presence package.

Accept: This field is populated with the value 'application/pidf+xml' and 'application/pidf-partial+xml',

latter one with higher preference.

To: Same as the Request-URI.

2. SUBSCRIBE request (P-CSCF to S-CSCF) – see example in table A.3.2.1-2

The P-CSCF looks up the serving network information for the public user identity that was stored during the registration procedure. The SUBSCRIBE request is forwarded to S-CSCF. A Route header is inserted into SUBSCRIBE request. The information for the Route header is taken from the service route determined during registration.

Table A.3.2.1-2: SUBSCRIBE request (P-CSCF to S-CSCF)

```
SUBSCRIBE sip:user2 public1@home2.net SIP/2.0
Via: SIP/2.0/UDP pcscf1.home1.net;branch=z9hG4bK240f34.1, SIP/2.0/UDP

```

3. Evaluation of initial filter criteria

S-CSCF#1 validates the service profile of this subscriber and evaluates the initial filter criteria. For this example, assume no Application Server involvement.

4. SUBSCRIBE request (S-CS CF to I-CSCF) – see example in table A.3.2.1-4

S-CSCF#1 performs an analysis of the destination address, and determines the network operator to whom the destination subscriber belongs. Since the originating operator does not desire to keep their internal configuration hidden, S-CSCF#1 forwards the SUBSCRIBE request directly to the I-CSCF in the destination network.

Table A.3.2.1-4: SUBSCRIBE (S-CSCF to I-CSCF)

```
SUBSCRIBE sip:user2 public1@home2.net SIP/2.0
Via: SIP/2.0/UDP scscf1.home1.net;branch=z9hG4bK351g45.1, SIP/2.0/UDP
      pcscfl.homel.net;branch=z9hG4bK240f34.1, SIP/2.0/UDP

5. Cx: User Location Query procedure

The I-CSCF sends a query to the HSS to find out the S-CSCF of the called user. The HSS responds with the address of the current S-CSCF for the terminating subscriber.

For detailed message flows see 3GPP TS 29.228 [9].

Table A.3.2.1-5a provides the parameters in the SIP SUBSCRIBE request (flow 4), which are sent to the HSS.

Table A.3.2.1-5a: Cx: User registration status query procedure (I-CSCF to HSS)

Message source & destination	Cx: Information element name	Information source in SIP SUBSCRIBE	Description
I-CSCF to HSS	User Public Identity	Request-URI	This information element indicates the public user identity

Table A.3.2.1-5b provides the parameters sent from the HSS that need to be mapped to the SIP SUBSCRIBE request (flow 6) and sent to the S-CSCF.

Table A.3.2.1-5b: Cx: User registration status query procedure (HSS to I-CSCF)

Message source & destination	Cx: Information element name	Mapping to SIP header in SIP SUBSCRIBE	Description
HSS to I-CSCF	S-CSCF name	Route header field	This information indicates the serving CSCF's name of that user

6. SUBSCRIBE request (I-CSCF to S-CSCF) – see example in table A.3.2.1-6

The I-CSCF forwards the SUBSCRIBE request to the S-CSCF (S-CSCF#2) that will handle the termination.

Table A.3.2.1-6: SUBSCRIBE request (I-CSCF to S-CSCF)

```
SUBSCRIBE sip:user2 public1@home2.net SIP/2.0
Via: SIP/2.0/UDP icscf2 s.home2.net;branch=z9hG4bK871y12.1, SIP/2.0/UDP
      scscfl.homel.net; branch=z9hG4bK351g45.1, SIP/2.0/UDP
      pcscf1.home1.net;branch=z9hG4bK240f34.1, SIP/2.0/UDP
      [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKnashds7
Max-Forwards: 67
P-Asserted-Identity:
P-Charging-Vector:
Privacy:
Route: <sip:scscf2.home2.net;lr>
Record-Route:
From:
To:
Call-ID:
CSeq:
Event:
Expires:
Accept:
Contact:
Content-Length:
```

NOTE: The I-CSCF does not add itself to the Record-Route header, as it has no need to remain in the signalling path for the subsequent requests.

7. Evaluation of initial filter criteria

S-CSCF#2 validates the service profile of this subscriber and evaluates the initial filter criteria. For sip:user2_public1@home2.net S-CSCF#2 has termination initial filter criteria with service points of interest of Method = SUBSCRIBE and Event = 'presence' and action = 'create Record-Route entry: no' that informs the S-CSCF to route the SUBSCRIBE request to the Application Server ps.home2.net and not to create a Record-Route entry for the request.

8. SUBSCRIBE request (S-CS CF to PS) – see example in table A.3.2.1-8

The S-CSCF forwards the SUBSCRIBE request to the PS.

Table A.3.2.1-8: SUBSCRIBE request (S-CSCF to PS)

```
SUBSCRIBE sip:user2_public1@home2.net SIP/2.0
Via: SIP/2.0/UDP scscf2.home2.net;branch=z9hG4bK764z87.1, SIP/2.0/UDP
      icscf2 s.home2.net;branch=z9hG4bK871y12.1, SIP/2.0/UDP
      scscf1.home1.net;branch=z9hG4bK351g45.1, SIP/2.0/UDP
      pcscfl.homel.net;branch=z9hG4bK240f34.1, SIP/2.0/UDP
      [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKnashds7
Max-Forwards: 66
P-Asserted-Identity:
P-Charging-Vector: icid-value="AyretyU0dm+602IrT5tAFrbHLso=023551024"; orig-ioi=home1.net
P-Charging-Function-Addresses: ccf=[5555::b99:c88:d77:e66]; ccf=[5555::a55:b44:c33:d22];
      ecf=[5555::1ff:2ee:3dd:4ee]; ecf=[5555::6aa:7bb:8cc:9dd]
Privacy:
Route: <sip:ps.home2.net;lr>, <sip:scscf2.home2.net;lr>
Record-Route:
From:
To:
Call-ID:
CSeq:
Event:
Expires:
Accept:
Contact:
Content-Length:
```

P-Charging-Vector: The S-CSCF stores the originating Inter Operator Identifier (IOI) parameter received and populates the identifier of its own network to the originating Inter Operator Identifier (IOI) parameter of this header and removes the terminating IOI parameter.

P-Charging-Function-Addresses: The S-CSCF populates the P-Charging-Function-Addresses header field to be passed to the PS.

9. Authorisation of watcher

The PS performs the necessary authorisation checks on the originator to ensure it is allowed to watch the presentity. In this example all privacy conditions are met, so the PS sends a 200 (OK) response to the S-CSCF.

In the case where the privacy/authorisation checks failed, then a necessary 2xx or 4xx response would be sent to the S-CSCF. The selection of the correct response code depends on the presentity's subscription authorisation policy document.

10. 200 (OK) response (PS to S-CSCF) - see example in table A.3.2.1-10

The PS sends the response to S-CSCF#2.

Table A.3.2.1-10: 200 (OK) response (PS to S-CSCF)

```
SIP/2.0 200 OK
Via: SIP/2.0/UDP scscf2.home2.net;branch=z9hG4bK764z87.1, SIP/2.0/UDP

15. NOTIFY request (PS to S-CSCF) - see example in table A.3.2.1-15

As soon as the PS sends a 200 (OK) response to accept the subscription, it sends a NOTIFY request with the current state of the presentity's presence tuples that the watcher has subscribed and been authorised to. The NOTIFY request is sent to S-CSCF#1. Based on the Accept header field of the SUBSCRIBE request, the PS decides to use the 'application/pidf-partial+xml' content type in the NOTIFY request.

Table A.3.2.1-15: NOTIFY request (PS to S-CSCF)

```

A.3.3 Watcher subscribing to resource list, UE in visited network

A.3.3.1 Watcher subscribing to his own resource list, UE in visited network - Successful subscription

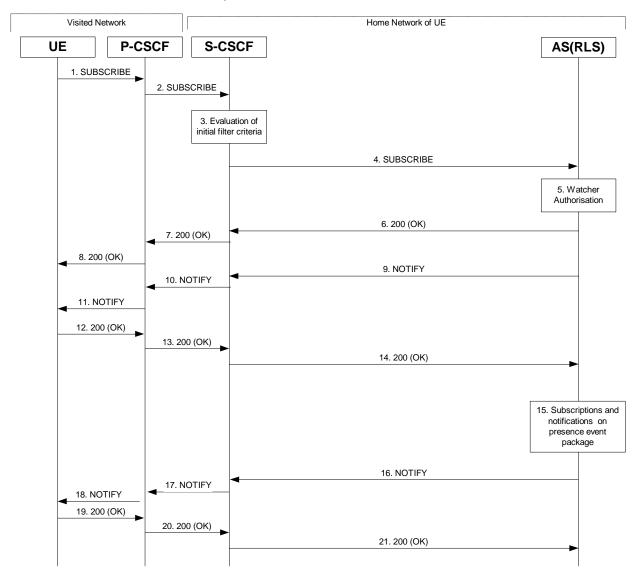

Figure A.3.3.1-1: Watcher subscribing to resource list

Figure A.3.3.1-1 shows a watcher subscribing to resource list event notification. The details of the signalling flows as follows:

1. SUBSCRIBE request (UE to P-CSCF) – see example in table A.3.3.1-1

A watcher agent in a UE wishes to watch a number of presentities, or certain presence tuples of these presentities. The list of presentities are identified by a SIP URI. In order to initiate a subscription to the RLS, the UE generates a SUBSCRIBE request indicating support for 'eventlist', together with an indication of the length of time this periodic subscription should last.

Table A.3.3.1-1: SUBSCRIBE request (UE to P-CSCF)

```
SUBSCRIBE sip:user1 list1@home1.net SIP/2.0
Via: SIP/2.0/UDP [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKehuefdam
Max-Forwards: 70
P-Access-Network-Info: 3GPP-UTRAN-TDD; utran-cell-id-3gpp=234151D0FCE11
Route: <sip:pcscf1.visited1.net:7531;lr;comp=sigcomp>, <sip:orig@scscf1.home1.net;lr>
P-Preferred-Identity: <sip:user1 public1@home1.net>
From: <sip:user1 public1@home1.net>;tag=31415
To: <sip:user1 list1@home1.net>
Call-ID: b89rjhnedlrfjflslj40a222
CSeq: 123 SUBSCRIBE
Require: sec-agree
Proxy-Require: sec-agree
Security-Verify: ipsec-3gpp; q=0.1; alg=hmac-sha-1-96; spi-c=98765432; spi-s=87654321; port-
      c=8642; port-s=7531
Event: presence
Supported: eventlist
Expires: 7200
Accept: application/pidf+xml, application/rlmi+xml, multipart/related
Contact: <sip:[5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp>
Content-Length: 0
```

Request-URI: SIP URI of the resource list representing the collection of public user identities whose events the

subscriber subscribes to.

Event: This field is populated with the value 'presence' to specify the use of the presence package.

Accept: This field is populated with the value 'application/pidf+xml', 'application/rlmi+xml' and

'multipart/related' indicating that the UE supports both body types for the eventlist extension

additionally to PIDF.

Supported: This field is populated with the value 'eventlist' to specify the support for the eventlist extension.

To: Same as the Request-URI.

2. SUBSCRIBE request (P-CSCF to S-CSCF) – see example in table A.3.3.1-2

The P-CSCF looks up the serving network information for the public user identity that was stored during the registration procedure. The SUBSCRIBE request is forwarded to S-CSCF#1. A Route header is inserted into SUBSCRIBE request. The information for the Route header is taken from the service route determined during registration.

Table A.3.3.1-2: SUBSCRIBE request (P-CSCF to S-CSCF)

```
SUBSCRIBE sip:user1 list1@home1.net SIP/2.0
Via: SIP/2.0/UDP pcscf1.visited1.net;branch=z9hG4bK120f34.1, SIP/2.0/UDP
      [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKehuefdam
P-Access-Network-Info:

Contact:
Content-Length:
```

3. Evaluation of initial filter criteria

The S-CSCF validates the service profile of this subscriber and evaluates the initial filter criteria. Assuming that sip:user1_list1@home1.net is a statically created PSI, sip:user1_list1@home1.net is included in the service profile as part of an originating initial Filter Criteria with Service Trigger Point of Method = SUBSCRIBE AND Supported = 'eventlist' AND Request-URI = sip:user1_list1@home1.net that informs the S-CSCF to route the SUBSCRIBE request to the application server sip:rls.home1.net.

If there is no initial filter criteria for this PSI (sip:user1_list1@home1.net), the assumption is that the PSI is a sub domain-based PSI. The procedure defined in RFC 3263 [17] with DNS NAPTR and SRV queries may then be used to get the IP address of the application server home1.net.

Editor's Note: The handling of alternative PSI routing examples should be described and expanded in section A.3.1 rather than in this location.

4. SUBSCRIBE request (S-CS CF to RLS) – see example in table A.3.3.1-4

The S-CSCF forwards the SUBSCRIBE request to the RLS.

Table A.3.3.1-4 SUBSCRIBE request (S-CSCF to RLS)

```
SUBSCRIBE sip:user1 list1@home1.net SIP/2.0
Via: SIP/2.0/UDP scscf1.home1.net;branch=z9hG4bK344a65.1, SIP/2.0/UDP
      pcscf1.visited1.net;branch=z9hG4bK120f34.1, SIP/2.0/UDP
      [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKehuefdam
Max-Forwards: 68
P-Access-Network-Info:
P-Asserted-Identity: <sip:user1 public1@home1.net>, <tel:+1-212-555-1111>
P-Charging-Vector: icid-value="AyretyU0dm+602IrT5tAFrbHLso=223551024"; orig-ioi=home1.net
P-Charging-Function-Addresses: ccf=[5555::b99:c88:d77:e66]; ccf=[5555::a55:b44:c33:d22];
      ecf=[5555::1ff:2ee:3dd:4ee]; ecf=[5555::6aa:7bb:8cc:9dd]
Record-Route: <sip:orig@scscf1.home1.net;lr>, <sip:pcscf1.visited1.net;lr>
Route: <sip:rls.homel.net;lr>, <sip:orig@scscfl.homel.net;lr>
From:
To:
Call-ID:
CSeq:
Event:
Supported:
Expires:
Accept:
Contact:
Content-Length:
```

P-Charging-Vector: The S-CSCF populates the identifier of its own network to the originating Inter Operator Identifier (IOI) parameter of this header.

P-Charging-Function-Addresses: The S-CSCF populates the P-Charging-Function-Addresses header field to be passed to the RLS.

5. Authorisation of watcher

The RLS performs the necessary authorisation checks on the originator to ensure that he/she is authorised to use the resource list. In this example this condition has been met, so the PS sends a 200 (OK) response to the S-CSCF. If the previous condition failed, then a 403 (Forbidden) response would be sent to the S-CSCF.

6. 200 (OK) response (RLS to S-CSCF) - see example in table A.3.3.1-6

The RLS sends the response to the S-CSCF.

Table A.3.3.1-6: 200 (OK) response (RLS to S-CSCF)

```
SIP/2.0 200 OK
Via: SIP/2.0/UDP scscf1.home1.net;branch=z9hG4bK344a65.1, SIP/2.0/UDP
    pcscf1.visited1.net;branch=z9hG4bK120f34.1, SIP/2.0/UDP
    [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKehuefdam

12. 200 (OK) response (UE to P-CSCF) – see example in table A.3.3.1-12

The UE acknowledges the NOTIFY request with a 200 (OK) response to the P-CSCF.

Table A.3.3.1-12: 200 (OK) response (UE to P-CSCF)

13. 200 (OK) response (P-CSCF to S-CSCF) – see example in table A.3.3.1-13

The P-CSCF forwards the 200 (OK) response to the S-CSCF.

Table A.3.3.1-13: 200 (OK) response (P-CSCF to S-CSCF)

14. 200 (OK) response (S-CSCF to RLS) – see example in table A.3.3.1-14

The S-CSCF#2 forwards the response to the RLS in the home network of the UE.

Table A.3.3.1-14: 200 (OK) response (S-CSCF to RLS)

P-Charging-Vector: The S-CSCF inserts the originating Inter Operator Identifier (IOI) parameter received and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.

15. Subscriptions and notifications on presence event package

After the RLS generated a NOTIFY request to inform the UE about the subscription state, the RLS generates the necessary SUBSCRIBE requests to the presentities present in the resource list as described in subclause A.3.4.1. As soon as it receives NOTIFY request(s) about a state change in one or more presentities, it generates a NOTIFY request.

16. NOTIFY request (RLS to S-CS CF) – see example in table A.3.3.1-16

The RLS copies the body of the incoming NOTIFY request(s) into the body of the outgoing NOTIFY request using MIME type multipart/related. Further notification sent by the RLS may contain either the full or the partial set of presence information (only the presence information that has changed since the last notification) as described in draft-ietf-simple-event-list-04 [21].

In this example it is assumed that the RLS has received two NOTIFY requests from presentities sip:user2_public1@home2.net and sip:user3_public1@home3.net before generating the NOTIFY request in table A.3.3.1-16 to the UE.

Table A.3.3.1-16 NOTIFY request (RLS to S-CSCF)

```
NOTIFY sip:[5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp SIP/2.0

     </tuple>
```

- **P-Charging-Vector:** The RLS inserts this header and populates the icid parameters with a globally unique value and adds the identifier of its own network to the originating Inter Operator Identifier (IOI) parameter of this header.
- **P-Charging-Function-Addresses**: The RLS populates the P-Charging-Function-Addresses header field to be passed to the S-CSCF.

Content-Type: Set to the value of the Accept: header received in the SUBSCRIBE request.

The message body in the NOTIFY request that carries the presence information of the presentity is formed as indicated in draft-ietf-simple-event-list-04 [21], draft-ietf-simple-rpid-03 [25], draft-ietf-simple-cipid-01 [31] and draft-ietf-simple-prescaps-ext-00 [24].

17. NOTIFY request (S-CSCF to P-CSCF) – see example in table A.3.3.1-17

The S-CSCF forwards the NOTIFY request to the P-CSCF.

Table A.3.3.1-17: NOTIFY request (S-CSCF to P-CSCF)

```
NOTIFY sip:[5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp SIP/2.0

```

20. 200 (OK) response (P-CSCF to S-CSCF) – see example in table A.3.3.1-20

The P-CSCF forwards the 200 (OK) response to the S-CSCF.

Table A.3.3.1-20: 200 (OK) response (P-CSCF to S-CSCF)

21. 200 (OK) response (S-CSCF to RLS) – see example in table A.3.3.1-21

The S-CSCF#2 forwards the response to the RLS in the home network of the UE.

Table A.3.3.1-21: 200 (OK) response (S-CSCF to RLS)

P-Charging-Vector: The S-CSCF inserts the originating Inter Operator Identifier (IOI) parameter received and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.

A.3.3.2 Watcher subscribing to a resource list, UE in visited network - successful subscription

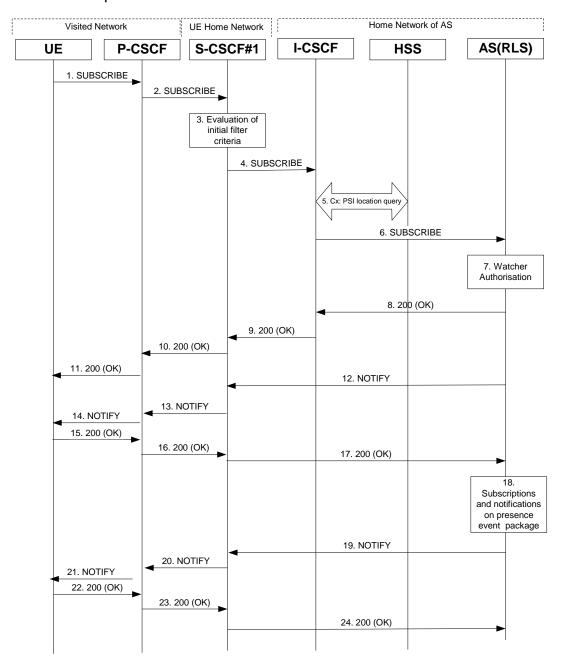

Figure A.3.3.2-1 Watcher subscribing to resource list

Figure A.3.3.2-1 shows a watcher subscribing to resource list event notification. The details of the signalling flows as follows:

1. SUBSCRIBE request (UE to P-CSCF) – see example in table A.3.3.2-1

A watcher agent in a UE wishes to watch a number of presentities, or certain presence tuples of these presentities. The list of presentities are identified by a SIP URI. In order to initiate a subscription to the RLS, the UE generates a SUBSCRIBE request indicating support for 'eventlist', together with an indication of the length of time this periodic subscription should last.

Table A.3.3.2-1: SUBSCRIBE request (UE to P-CSCF)

```
SUBSCRIBE sip:user2 list1@home2.net SIP/2.0
Via: SIP/2.0/UDP [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKehuefdam
Max-Forwards: 70
P-Access-Network-Info: 3GPP-UTRAN-TDD; utran-cell-id-3gpp=234151D0FCE11
Route: <sip:pcscf1.visited1.net:7531;lr;comp=sigcomp>, <sip:orig@scscf1.home1.net;lr>
P-Preferred-Identity: <sip:user1 public1@home1.net>
From: <sip:user1 public1@home1.net>;tag=31415
To: <sip:user2 list1@home1.net>
Call-ID: b89rjhnedlrfjflslj40a222
CSeq: 123 SUBSCRIBE
Require: sec-agree
Proxy-Require: sec-agree
Security-Verify: ipsec-3gpp; q=0.1; alg=hmac-sha-1-96; spi-c=98765432; spi-s=87654321; port-
      c=8642; port-s=7531

Supported: eventlist
Expires: 7200
Accept: application/pidf+xml, application/rlmi+xml, multipart/related
Contact: <sip:[5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp>
Content-Length: 0
```

Request-URI: SIP URI of the resource list representing the collection of public user identities whose events the

subscriber subscribes to.

Event: This field is populated with the value 'presence' to specify the use of the presence package.

Accept: This field is populated with the value 'application/pidf+xml', 'application/rlmi+xml' and

'multipart/related' indicating that the UE supports the eventlist extension additionally to PIDF.

Supported: This field is populated with the value 'eventlist' to specify the support for the event list extension.

To: Same as the Request-URI.

2. SUBSCRIBE request (P-CSCF to S-CSCF) – see example in table A.3.3.2-2

The P-CSCF looks up the serving network information for the public user identity that was stored during the registration procedure. The SUBSCRIBE request is forwarded to S-CSCF#1. A Route header is inserted into SUBSCRIBE request. The information for the Route header is taken from the service route determined during registration.

Table A.3.3.2-2: SUBSCRIBE request (P-CSCF to S-CSCF)

```
SUBSCRIBE sip:user2 list1@home2.net SIP/2.0
Via: SIP/2.0/UDP pcscf1.visited1.net;branch=z9hG4bK120f34.1, SIP/2.0/UDP

3. Evaluation of initial filter criteria

S-CSCF#1 validates the service profile of this subscriber and evaluates the initial filter criteria. For this example, assume no application server involvement.

4. SUBSCRIBE request (S-CSCF to I-CSCF) – see example in table A.3.3.2-4

S-CSCF#1 performs an analysis of the destination address. As the destination address points to a resource that is in a different network as the S-CSCF, the S-CSCF sends the request to the I-CSCF of home2.net.

Table A.3.3.2-4: SUBSCRIBE request (S-CSCF to I-CSCF)

```
SUBSCRIBE sip:user2 list1@home2.net SIP/2.0
Via: SIP/2.0/UDP scscf1.home1.net;branch=z9hG4bK344a65.1, SIP/2.0/UDP

5. PSIlocation query

The I-CSCF sends a query to the HSS to find the RLS where sip:user2_list1@home2.net is hosted. The HSS responds with the address of the RLS.

Editor's Note: More detailed information is needed here, similar to the Cx interface information given in 24.228.

6. SUBSCRIBE request (I-CSCF to RLS) – see example in table A.3.3.2-6

The I-CSCF forwards the SUBSCRIBE request to the RLS.

Table A.3.3.2-6: SUBSCRIBE request (I-CSCF to S-CSCF)

```
SUBSCRIBE sip:user2 list1@home2.net SIP/2.0
Via: SIP/2.0/UDP icscf2 s.home2.net;branch=z9hG4bK871y12.1, SIP/2.0/UDP

7. Authorisation of watcher

The RLS performs the necessary authorisation checks on the originator to ensure that he/she is authorized to use the resource list. In this example this condition has been met, so the PS sends a 200 (OK) response to the S-CSCF. If the previous condition failed, then a 403 (Forbidden) response would be sent to the S-CSCF.

8. 200 (OK) response (RLS to I-CSCF) - see example in table A.3.3.2-8

The RLS sends the response to the S-CSCF.

Table A.3.3.2-8: 200 (OK) response (RLS to I-CSCF)

```
SIP/2.0 200 OK
Via: SIP/2.0/UDP icscf2 s.home2.net;branch=z9hG4bK871y12.1, SIP/2.0/UDP

```

12. NOTIFY request (RLS to S-CS CF) – see example in table A.3.3.2-12

The RLS generates a NOTIFY request including the RLMI document as a result of the SUBSCRIBE request.

Table A.3.3.2-12: NOTIFY request (RLS to S-CSCF)

```
NOTIFY sip:[5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp SIP/2.0
Via: SIP/2.0/UDP rls.home2.net;branch=z9hG4bK240f34.1
Max-Forwards: 70
P-Charging-Vector: icid-value="AyretyU0dm+602IrT5tAFrbHLso=123551024"; orig-ioi=home1.net
Route: <sip:scscfl.homel.net;lr>, <sip:pcscfl.visitedl.net;lr>
From: <sip:user2 list1@home1.net>;tag=151170
To: <sip:user1 public1.home1.net>;tag=31415
Call-ID: b89rjhnedlrfjflslj40a222
CSeq: 89 NOTIFY
Subscription-State: active; expires=5000
Require: eventlist
Event: presence
Contact: <sip:rls.home1.net>
Content-Type: application/rlmi+xml; charset="UTF-8"
Content-Length: (...)
<?xml version="1.0" encoding="UTF-8"?>
  <list xmlns="urn:ietf:params:xml:ns:rmli"</pre>
        uri="sip:user1_list1@home1.net" version="1" fullState="true">
     <re><resource uri="pres:user2_public1@home2.net" name="Kovacs Janos"></re>
       <instance id="hqzsuxtfyq" state="active" cid="ZvSvkz@rls.home2.net"/>
     </resource>
     <resource uri="pres:user3_public1@home2.net" name="Szabo Bela">
       <instance id="aakdsjklsa" state="active" cid="HJjbssk@rls.home2.net"/>
     </resource>
  </list>
```

P-Charging-Vector: The RLS populates the icid parameter with a globally unique value and populates the identifier of its own network to the originating Inter Operator Identifier (IOI) parameter of this header.

13. NOTIFY request (S-CSCF to P-CSCF) – see example in table A.3.3.2-13

The S-CSCF#1 forwards the NOTIFY request to the P-CSCF.

Table A.3.3.2-13: NOTIFY request (S-CSCF to P-CSCF)

```
NOTIFY sip:[5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp SIP/2.0
Via: SIP/2.0/UDP scscf1.home1.net;branch=z9hG4bK332b23.1, SIP/2.0/UDP
      rls.home2.net;branch=z9hG4bK240f34.1
P-Charging-Vector: icid-value="AyretyU0dm+602IrT5tAFrbHLso=123551024"
P-Charging-Function-Addresses: ccf=[5555::b99:c88:d77:e66]; ccf=[5555::a55:b44:c33:d22];
      ecf=[5555::1ff:2ee:3dd:4ee]; ecf=[5555::6aa:7bb:8cc:9dd]
Max-Forwards: 69
Record-Route: <sip:scscf1.home1.net;lr>
Route: <sip:pcscfl.visitedl.net;lr>
From:
To:
Call-ID:
CSeq:
Subscription-State:
Require:
Event:
Contact:
Content-Type:
Content-Length:
(...)
```

P-Charging-Vector: The S-CSCF stores the originating Inter Operator Identifier (IOI) parameter.

P-Charging-Function-Addresses: The RLS populates the P-Charging-Function-Addresses header field to be passed to the I-CSCF.

14. NOTIFY request (P-CS CF to UE) – see example in table A.3.3.2-14

The P-CSCF forwards the NOTIFY request to the watcher application in the UE.

Table A.3.3.2-14: NOTIFY request (P-CSCF to UE)

15. 200 (OK) response (UE to P-CSCF) – see example in table A.3.3.2-15

The UE acknowledges the NOTIFY request with a 200 (OK) to the P-CSCF.

Table A.3.3.2-15: 200 (OK) response (UE to P-CSCF)

16. 200 (OK) response (P-CSCF to S-CSCF) – see example in table A.3.3.2-16

The P-CSCF forwards the 200 (OK) response to the S-CSCF#1.

Table A.3.3.2-16: 200 (OK) response (P-CSCF to S-CSCF)

17. 200 (OK) response (S-CSCF to RLS) – see example in table A.3.3.2-17

The S-CSCF#1 forwards the response to the RLS in the home network of the UE.

Table A.3.3.2-17: 200 (OK) response (S-CSCF to RLS)

P-Charging-Vector: The S-CSCF insertes the originating Inter Operator Identifier (IOI) parameter received and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.

18. Subscriptions and notifications on presence event package

After the RLS generated a 200 (OK) response to the SUBSCRIBE request from the UE, it generates the necessary SUBSCRIBE requests to the presentities present in the resource list as described in subclause A.3.4.1. As soon as it receives NOTIFY request(s) about a state change in one or more presentities, it generates a NOTIFY request.

19. NOTIFY request (RLS to S-CS CF) – see example in table A.3.3.2-19

The RLS copies the body of the incoming NOTIFY request(s) into the body of the outgoing NOTIFY request using MIME type multipart/related. Further notification sent by the RLS contain may contain either the full or the partial set of presence information (only the presence information that has changed since the last notification) as described in draft-ietf-simple-event-list-04 [21].

In this example it is assumed that the RLS receives two NOTIFY requests from presentities sip:user2_public1@home2.net and sip:user3_public1@home3.net before generating the NOTIFY request in A.3.3.2-23 to the UE.

Table A.3.3.2-19: NOTIFY request (RLS to S-CSCF)

```
NOTIFY sip:[5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp SIP/2.0

P-Charging-Vector: The RLS populates the icid parameter with a globally unique value and populates the identifier of its own network to the originating Inter Operator Identifier (IOI) parameter of this header.

Content-Type: Set to the value of the Accept: header received in the SUBSCRIBE request.

The message body in the NOTIFY request that carries the presence information of the presentity is formed as indicated in draft-ietf-simple-event-list-04 [21], draft-ietf-simple-rpid-03 [25], draft-ietf-simple-cipid-01 [31] and draft-ietf-simple-prescaps-ext-00 [24].

20. NOTIFY request (S-CSCF to P-CSCF) – see example in table A.3.3.2-20

The S-CSCF#1 forwards the NOTIFY request to the P-CSCF.

Table A.3.3.2-20: NOTIFY request (S-CSCF to P-CSCF)

```
NOTIFY sip:[5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp SIP/2.0

```

P-Charging-Vector: The S-CSCF stores the terminating Inter Operator Identifier (IOI) parameter received.

P-Charging-Function-Addresses: The S-CSCF populates the P-Charging-Function-Addresses header field to be passed to the P-CSCF.

21. NOTIFY request (P-CS CF to UE) – see example in table A.3.3.2-21

The P-CSCF forwards the NOTIFY request to the watcher application in the UE.

Table A.3.3.2-21: NOTIFY request (P-CSCF to UE)

22. 200 (OK) response (UE to P-CSCF) – see example in table A.3.3.2-22

The UE acknowledges the NOTIFY request with a 200 (OK) to the P-CSCF.

Table A.3.3.2-22: 200 (OK) response (UE to P-CSCF)

23. 200 (OK) response (P-CSCF to S-CSCF) – see example in table A.3.3.2-23

The P-CSCF forwards the 200 (OK) response to the S-CSCF#1.

Table A.3.3.2-23: 200 (OK) response (P-CSCF to S-CSCF)

24. 200 (OK) response (S-CSCF to RLS) – see example in table A.3.3.2-24

The S-CSCF#2 forwards the response to the RLS in the home network of the UE.

Table A.3.3.2-24: 200 (OK) response (S-CSCF to RLS)

P-Charging-Vector: The S-CSCF inserts the originating Inter Operator Identifier (IOI) parameter received and populates the identifier of its own network to the originating Inter Operator Identifier (IOI) parameter of this header.

A.3.4 RLS subscribing to presentities in different network

A.3.4.1 Successful subscription

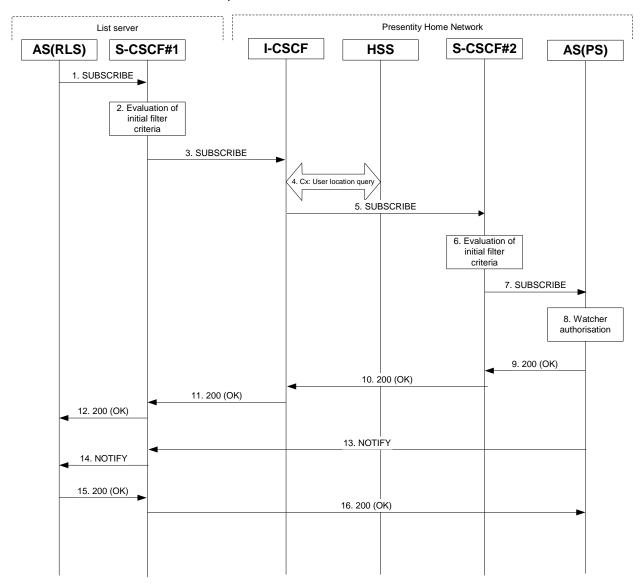

Figure A.3.4.1-1 RLS subscribing to presentities in different network

Figure A.3.4.1-1 shows the RLS subscribing to presence event notification about a presentity. The presentity is in a different IM CN subsystem. The details of the signalling flows as follows:

1. SUBSCRIBE request (RLS to S-CSCF) – see example in table A.3.4.1-1

The RLS resolves the watcher's resource address (the address is received according to subclause A.3.3) and subscribes to presence event notification at all the presentities that are represented by the resource list SIP URI. The home network of these presentities can be different or in the same network, as the RLS. In this example only a single subscription is shown where the home network of the presentity is another network. Subscriptions to other presentities follow a similar procedure. To initiate a subscription, the RLS generates a SUBSCRIBE request containing the 'presence' event that it wishes to be notified of, together with an indication of the length of time this periodic subscription should last. The RLS sends the SUBSCRIBE request to the S-CSCF of 'sip:user1_public1@home1.net' (S-CSCF#1). The address of S-CSCF#1 is either remembered from previous transactions (when 'sip:user1_public1@home1.net' has subscribed for the resource list) or queried by the RLS using the Sh interface.

Table A.3.4.1-1 SUBSCRIBE request (RLS to S-CSCF)

```
SUBSCRIBE sip:user2 public1@home2.net SIP/2.0
Via: SIP/2.0/UDP rls.home1.net;branch=z9hG4bKehuefdam
Max-Forwards: 70
Route: <sip:scscfl.homel.net;lr>
P-Asserted-Identity: <sip:user1 public1@home1.net>
P-Charging-Vector: icid-value="AyretyU0dm+602IrT5tAFrbHLso=323551024"; orig-ioi=home1.net
P-Charging-Function-Addresses: ccf=[5555::b99:c88:d77:e66]; ccf=[5555::a55:b44:c33:d22];
      ecf=[5555::1ff:2ee:3dd:4ee]; ecf=[5555::6aa:7bb:8cc:9dd]
From: <sip:user1 public1@home1.net>;tag=31415
To: <sip:user2 public1@home2.net>
Call-ID: q987a9a87g087abgf7qyg7ag
CSeq: 123 SUBSCRIBE
Event: presence
Expires: 7200
Accept: application/pidf+xml
Contact: <sip:rls.homel.net>
Content-Length: 0
```

Request-URI: Public user identity whose events the RLS subscribes to.

P-Charging-Vector: The RLS populates the icid parameter with a new globally unique value and populates the originating Inter Operator Identifier (IOI) parameter with the identifier of its own network of RLS.

P-Charging-Function-Addresses: The RLS populates the P-Charging-Function-Addresses header field to be passed to the S-CSCF.

To: Same as the Request-URI.

Event: This field is populated with the value 'presence' to specify the use of the presence package.

Accept: This field is populated with the value 'application/pidf+xml'.

2. Evaluation of initial filter criteria

S-CSCF#1 validates the service profile of this subscriber and evaluates the initial filter criteria. For this example, assume no application server involvement.

3. SUBSCRIBE request (S-CS CF to I-CSCF) – see example in table A.3.4.1-3

S-CSCF#1 performs an analysis of the destination address, and determines the network operator to whom the destination subscriber belongs. S-CSCF#1 forwards the request to the I-CSCF.

Table A.3.4.1-3 SUBSCRIBE request (S-CSCF to I-CSCF)

```
SUBSCRIBE sip:user2 public1@home2.net SIP/2.0
Via: SIP/2.0/UDP scscf1.home1.net;branch=z9hG4bKehuehjgt, SIP/2.0/UDP
      rls.home1.net;branch=z9hG4bKehuefdam
Max-Forwards: 69
Record-Route: <sip:orig@scscfl.homel.net;lr>
P-Asserted-Identity:
P-Charging-Vector:
From:
To:
Call-ID:
CSeq:
Event:
Expires:
Accept:
Contact:
Content-Length:
```

P-Charging-Vector: The S-CSCF stores the originating Inter Operator Identifier (IOI) parameter received.

4. Cx: User Location Query procedure

The I-CSCF sends a query to the HSS to find out the S-CSCF of the presentity. The HSS responds with the address of the current S-CSCF for the presentity.

For detailed message flows see 3GPP TS 29.228 [9].

Table A.3.4.1-4a provides the parameters in the SIP SUBSCRIBE request (flow 3), which are sent to the HSS.

Table A.3.4.1-4a: Cx: User registration status query procedure (I-CSCF to HSS)

Message source & destination	Cx: Information element name	Information source in SIP SUBSCRIBE	Description
I-CSCF to HSS	User Public	Request-URI	This information
	Identity		element indicates the
			public user identity

Table A.3.4.1-4b provides the parameters sent from the HSS that need to be mapped to SIP SUBSCRIBE request (flow 5) and sent to the S-CSCF.

Table A.3.4.1-4b: Cx: User registration status query procedure (HSS to I-CSCF)

Message source & destination	Cx: Information element name	Mapping to SIP header in SIP SUBSCRIBE	Description
HSS to I-CSCF	S-CSCF name	Route header field	This information indicates the serving CSCF's name of that user

5. SUBSCRIBE request (I-CSCF to S-CSCF) – see example in table A.3.4.1-5

The I-CSCF forwards the SUBSCRIBE request to the S-CSCF#2 that will handle the termination.

Table A.3.4.1-5: SUBSCRIBE request (I-CSCF to S-CSCF)

```
SUBSCRIBE sip:user2 public1@home2.net SIP/2.0
Via: SIP/2.0/UDP icscf2 s.home2.net;branch=z9hG4bKj5hgrt2o, SIP/2.0/UDP
      scscfl.homel.net; branch=z9hG4bKehuehjgt, SIP/2.0/UDP
      rls.home1.net;branch=z9hG4bKehuefdam
Max-Forwards: 68
P-Asserted-Identity:
P-Charging-Vector: icid-value="AyretyU0dm+602IrT5tAFrbHLso=323551024"; orig-ioi=home1.net;
Route: <sip:scscf2.home2.net;lr>
Record-Route:
From:
To:
Call-ID:
CSeq:
Event:
Expires:
Accept:
Contact:
Content-Length:
```

6. Evaluation of initial filter criteria

S-CSCF#2 validates the service profile of this subscriber and evaluates the initial filter criteria. For sip:user2_public1@home2.net the S-CSCF has Termination initial Filter Criteria with Service Points of Interest of Method = SUBSCRIBE AND Event = 'presence' and action = 'create Record-Route entry: no' that informs the S-CSCF to route the SUBSCRIBE request to the Application Server ps.home2.net and do not create a Record-Route entry for the request.

7. SUBSCRIBE request (S-CS CF to PS) – see example in table A.3.4.1-7

The S-CSCF#2 forwards the SUBSCRIBE request to the PS.

Table A.3.4.1-7 SUBSCRIBE request (S-CSCF to PS)

```
SUBSCRIBE sip:user2 public1@home2.net SIP/2.0
Via: SIP/2.0/UDP scscf2.home2.net;branch=z9hG4bK344a65.1, SIP/2.0/UDP

P-Charging-Vector: The S-CSCF stores the originating Inter Operator Identifier (IOI) parameter received and populates the identifier of its own network to the originating Inter Operator Identifier (IOI) parameter of this header.

P-Charging-Function-Addresses: The S-CSCF populates the P-Charging-Function-Addresses header field to be passed to the PS.

8. Authorisation of watcher

The PS performs the necessary authorisation checks on the originator to ensure it is allowed to watch the presentity. In this example all privacy conditions are met, so the PS sends a 200 (OK) response to the S-CSCF.

In the case where the privacy/authorisation checks failed, then a necessary 2xx or 4xx response would be sent to the S-CSCF. The selection of the correct response code depends on the presentity's subscription authorisation policy document.

9. 200 (OK) response (PS to S-CSCF) - see example in table A.3.4.1-9

The PS sends the response to S-CSCF#2.

Table A.3.4.1-9: 200 (OK) response (PS to S-CSCF)

```

```

- **P-Charging-Vector:** The PS stores the originating Inter Operator Identifier (IOI) parameter received and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.
- **P-Charging-Function-Addresses**: The PS stores the P-Charging-Function-Addresses header field and passes this header to the S-CSCF.
- 10. 200 (OK) response (S-CSCF to I-CSCF) see example in table A.3.4.1-10

S-CSCF#2 forwards the response to the I-CSCF.

Table A.3.4.1-10: 200 (OK) response (S-CSCF to I-CSCF)

- **P-Charging-Vector:** The S-CSCF stores the terminating Inter Operator Identifier (IOI) parameter received and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.
- **P-Charging-Function-Addresses**: The S-CSCF stores the P-Charging-Function-Addresses header field and passes this header to the I-CSCF.
- 11. 200 (OK) response (I-CSCF to S-CSCF) see example in table A.3.4.1-11

The I-CSCF forwards the response to S-CSCF#1.

Table A.3.4.1-11: 200 (OK) response (I-CSCF to S-CSCF)

12. 200 (OK) response (S-CSCF to RLS) - see example in table A.3.4.1-12

S-CSCF#1 forwards the response to the RLS.

Table A.3.4.1-12: 200 (OK) response (S-CSCF to RLS)

- **P-Charging-Vector:** The S-CSCF stores the terminating Inter Operator Identifier (IOI) parameter received and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.
- **P-Charging-Function-Addresses**: The S-CSCF stores the P-Charging-Function-Addresses header field and passes this header to the RLS.

13. NOTIFY request (PS to S-CSCF) - see example in table A.3.4.1-13

As soon as the PS sends a 200 (OK) response to accept the subscription, it sends a NOTIFY request with the current state of the presentity's presence tuples that the watcher has subscribed and been authorised to. The NOTIFY request is sent to S-CSCF#1. Further notification sent by the PS may either contain the complete set of presence information, or only those presence tuples that have changed since the last notification.

Table A.3.4.1-13: NOTIFY request (PS to S-CSCF)

```

P-Charging-Vector: The S-CSCF stores the terminating Inter Operator Identifier (IOI) parameter and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.

A.3.5 Network based watcher subscribing on behalf of IMS watcher to IMS presentities

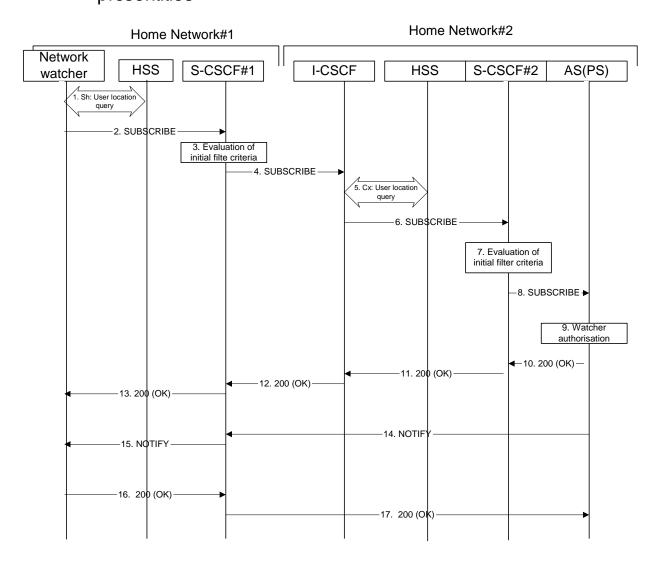

Figure A.3.5-1: Network based watcher subscribing on behalf of IMS watcher for presence information of IMS presentities

Figure A.3.5-1 shows a trusted network based watcher subscribing on behalf of an IMS watcher to presence event notification about an IMS based presentity. The presentity is in a different IM CN subsystem than the network based watcher and the signalling flow assumes that the IMS watcher on whose behalf the network based watcher subscribes is registered to the IMS network. The details of the signalling flows are as follows:

1. Sh: User Location Query procedure

The network based watcher sends a query to the HSS to find out the S-CSCF of the user on whose behalf the subscription is initiated. The HSS responds with the address of the current S-CSCF for the originating subscriber.

2. SUBSCRIBE request (Network based watcher to S-CSCF) – see example in table A.3.5-2

The SUBSCRIBE request is constructed and forwarded to S-CSCF. The S-CSCF is inserted into the Route header of the SUBSCRIBE request.

Table A.3.5-2: SUBSCRIBE request (network watcher to S-CSCF)

```
SUBSCRIBE sip:user2 public1@home2.net SIP/2.0
Via: SIP/2.0/UDP watcher.homel.net;branch=z9hG4bK240f34.1
P-Access-Network-Info:
Max-Forwards: 69
P-Asserted-Identity: <sip:user1 public1@home1.net>
Privacy: none
Route: <sip:scscfl.homel.net;lr;orig>
From: <sip:user1 public1@home1.net>;tag=31415
To: <sip:user2 public1@home2.net>
Call-ID: b89rjhnedlrfjflslj40a222
CSeq: 61 SUBSCRIBE
Event: PRESENCE
Expires: 7200
Accept: application/pidf+xml;q=0.3, application/pidf-partial+xml;q=1
Contact: <sip:[5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp>
Content-Length: 0
```

Request-URI: Public user identity of the user to whose events the subscriber subscribes to.

P-Asserted-Identity: The network based watcher inserts the public user identity of the watcher on whose behalf the subscription is made into the P-Asserted-Identity header field..

Route: The Route header is populated with the address of the S-CSCf obtained from the response to the

user location query performed by the network based watcher on the Sh interface.

Event: This field is populated with the value 'presence' to specify the use of the presence package.

Contact: The contact information of the network based watcher.

3. Evaluation of initial filter criteria

S-CSCF#1 validates the service profile of the subscriber identified in the P-Asserted-Identity header field and evaluates the initial filter criteria. For this example, assume no Application Server involvement.

4. SUBSCRIBE request (S-CS CF to I-CSCF) – see example in table A.3.5-4

S-CSCF#1 performs an analysis of the destination address, and determines the network operator to whom the destination subscriber belongs. Since the originating operator does not desire to keep their internal configuration hidden, S-CSCF#1 forwards the SUBSCRIBE request directly to the I-CSCF in the destination network.

Table A.3.5-4: SUBSCRIBE (S-CSCF to I-CSCF)

```
SUBSCRIBE sip:user2_public1@home2.net SIP/2.0
Via: SIP/2.0/UDP scscf1.home1.net;branch=z9hG4bK351g45.1, SIP/2.0/UDP
    network.home1.net;branch=z9hG4bK240f34.1,

Content-Length:
```

5. Cx: User Location Query procedure

The I-CSCF sends a query to the HSS to find out the S-CSCF of the called user. The HSS responds with the address of the current S-CSCF for the terminating subscriber.

For detailed message flows see 3GPP TS 29.228 [9].

Table A.3.5-5a provides the parameters in the SIP SUBSCRIBE request (flow 4), which are sent to the HSS.

Table A.3.5-5a: Cx: User registration status query procedure (I-CSCF to HSS)

Message source & destination	Cx: Information element name	Information source in SIP SUBSCRIBE	Description
I-CSCF to HSS	User Public Identity	Request-URI	This information element indicates the
			public user identity

Table A.3.5-5b provides the parameters sent from the HSS that need to be mapped to the SIP SUBSCRIBE request (flow 6) and sent to the S-CSCF.

Table A.3.5-5b: Cx: User registration status query procedure (HSS to I-CSCF)

Message source & destination	Cx: Information element name	Mapping to SIP header in SIP SUBSCRIBE	Description
HSS to I-CSCF	S-CSCF name	Route header field	This information indicates the serving CSCF's name of that user

$6. \quad SUBSCRIBE\ re\ quest\ (I-CSCF\ to\ S-CSCF)-see\ example\ in\ table\ A.3.5-6$

 $The \ I-CSCF \ forwards \ the \ SUBSCRIBE \ request \ to \ the \ S-CSCF \ (S-CSCF\#2) \ that \ will \ handle \ the \ termination.$

Table A.3.5-6: SUBSCRIBE request (I-CSCF to S-CSCF)

```
SUBSCRIBE sip:user2 public1@home2.net SIP/2.0
Via: SIP/2.0/UDP icscf2 s.home2.net;branch=z9hG4bK871y12.1, SIP/2.0/UDP
      scscfl.homel.net; branch=z9hG4bK351g45.1, SIP/2.0/UDP
      network.home1.net;branch=z9hG4bK240f34.1

Content-Length:
```

NOTE: The I-CSCF does not add itself to the Record-Route header, as it has no need to remain in the signalling path for the subsequent requests.

7. Evaluation of initial filter criteria

S-CSCF#2 validates the service profile of this subscriber and evaluates the initial filter criteria. For sip:user2_public1@home2.net S-CSCF#2 has termination initial filter criteria with service points of interest of Method = SUBSCRIBE and Event = 'presence' and action = 'c reate Record-Route entry: no' that informs the S-CSCF to route the SUBSCRIBE request to the Application Server ps.home2.net and not to create a Record-Route entry for the request.

8. SUBSCRIBE request (S-CS CF to PS) – see example in table A.3.5-8

The S-CSCF forwards the SUBSCRIBE request to the PS.

Table A.3.5-8: SUBSCRIBE request (S-CSCF to PS)

```
SUBSCRIBE sip:user2 public1@home2.net SIP/2.0
Via: SIP/2.0/UDP scscf2.home2.net;branch=z9hG4bK764z87.1, SIP/2.0/UDP

9. Authorisation of watcher

The PS performs the necessary authorisation checks on the watcher whose behalf the subscription is being made to ensure it is allowed to watch the presentity. In this example all privacy conditions are met, so the PS sends a 200 (OK) response to the S-CSCF.

In the case where the privacy/authorisation checks failed, then a necessary 2xx or 4xx response would be sent to the S-CSCF. The selection of the correct response code depends on the presentity's authorisation policy document.

10. 200 (OK) response (PS to S-CSCF) - see example in table A.3.5-10

The PS sends the response to S-CSCF#2.

Table A.3.5-10: 200 (OK) response (PS to S-CSCF)

11. 200 (OK) response (S-CSCF to I-CSCF) - see example in table A.3.5-11

S-CSCF#2 forwards the response to I-CSCF#2.

Table A.3.5-11: 200 (OK) response (S-CSCF to I-CSCF)

12. 200 (OK) res ponse (I-CSCF to S-CSCF) - see example in table A.3.5-12

I-CSCF#2 forwards the response to S-CSCF#1.

Table A.3.5-12: 200 (OK) response (I-CSCF to S-CSCF)

13. 200 (OK) response (S-CSCF to network watcher) - see example in table A.3.5-13

S-CSCF#1 forwards the response to request originator.

Table A.3.5-13: 200 (OK) response (S-CSCF to network watcher)

```
SIP/2.0 200 OK
Via: SIP/2.0/UDP network.homel.net;branch=z9hG4bK240f34.1

```

14. NOTIFY request (PS to S-CSCF) - see example in table A.3.5-14

As soon as the PS sends a 200 (OK) response to accept the subscription, it sends a NOTIFY request with the current state of the presentity's presence information that the watcher has subscribed and been authorised to. The NOTIFY request is sent to S-CSCF#1. Based on the Accept header field of the SUBSCRIBE request, the PS decides to use the 'application/pidf-partial+xml' content type in the NOTIFY request.

Table A.3.5-14: NOTIFY request (PS to S-CSCF)

```
NOTIFY sip: network.homel.net;branch=z9hG4bK240f34.1 SIP/2.0

A.3.6 Watcher subscribing to XCAP change, UE in visited network

A.3.6.1 Watcher subscribing to XCAP change in his resource list, UE in visited network - Successful subscription

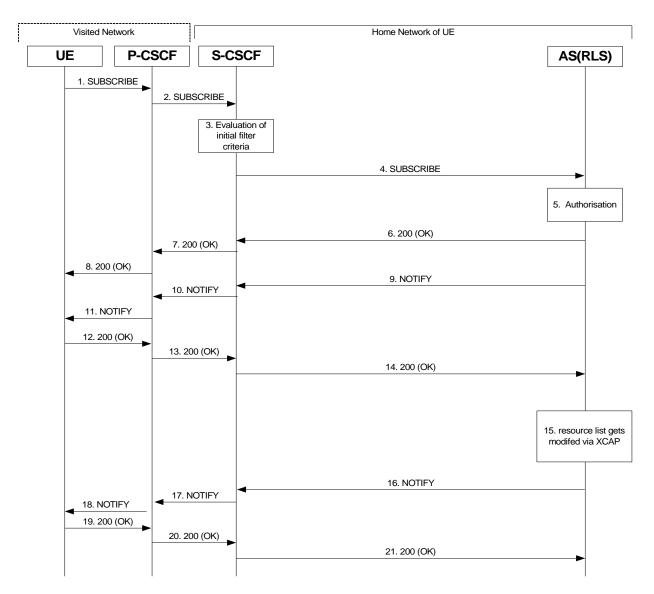

Figure A.3.6.1-1: Watcher subscribing to XCAP change in his resource list

Figure A.3.6.1-1 shows a watcher subscribing to XCAP change event notification. The details of the flows as follows:

1. SUBSCRIBE request (UE to P-CSCF) – see example in table A.3.6.1-1

A watcher agent in a UE wishes to get notification when his resource list gets modified via XCAP. In order to initiate a subscription to XCAP changes in RLS, the UE generates a SUBSCRIBE request indicating support for 'xcap-change', together with an indication of the length of time this periodic subscription should last.

Table A.3.6.1-1: SUBSCRIBE request (UE to P-CSCF)

```
SUBSCRIBE sip:user1_public1@home1.net SIP/2.0
Via: SIP/2.0/UDP [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKehuefdam
Max-Forwards: 70
P-Access-Network-Info: 3GPP-UTRAN-TDD; utran-cell-id-3gpp=234151D0FCE11
Route: <sip:pcscf1.visited1.net:7531;lr;comp=sigcomp>, <sip:orig@scscf1.home1.net;lr>
P-Preferred-Identity: <sip:user1 public1@home1.net>
Privacy: none
From: <sip:user1 public1@home1.net>;tag=31415
To: <sip:user1_public1@home1.net>
Call-ID: b89rjhnedlrfjflslj40a222
CSeq: 123 SUBSCRIBE
Require: sec-agree
Proxy-Require: sec-agree
Security-Verify: ipsec-3gpp; q=0.1; alg=hmac-sha-1-96; spi-c=98765432; spi-s=87654321; port-
      c=8642; port-s=7531
Event: xcap-change
Expires: 7200
Accept: application/xcap-change+xml

Content-Length: 0
```

Request-URI: The users own SIP URI to get notifications of changes on all lists owned by the user.

Event: This field is populated with the value 'xcap-change-' to specify the use of the xcap change package.

Accept: This field is populated with the value application/xcap-change+xml 'indicating that the UE

supports the xcap-change MIME type..

To: Same as the Request-URI.

2. SUBSCRIBE request (P-CSCF to S-CSCF) – see example in table A.3.6.1-2

The P-CSCF looks up the serving network information for the public user identity that was stored during the registration procedure. The SUBSCRIBE request is forwarded to S-CSCF#1. A Route header is inserted into SUBSCRIBE request. The information for the Route header is taken from the service route determined during registration.

Table A.3.6.1-2: SUBSCRIBE request (P-CSCF to S-CSCF)

```
SUBSCRIBE sip:user1_public1@home1.net SIP/2.0
Via: SIP/2.0/UDP pcscf1.visited1.net;branch=z9hG4bK120f34.1, SIP/2.0/UDP

3. Evaluation of initial filter criteria

The S-CSCF validates the service profile of this subscriber and evaluates the initial filter criteria. For sip:user1_public1@home1.net the S-CSCF has originating initial Filter Criteria with Service Point Trigger of Method = SUBSCRIBE AND Event = 'xcap-change' that informs the S-CSCF to route the SUBSCRIBE request to the Application Server sip:rls.home1.net.

4. SUBSCRIBE request (S-CS CF to RLS) – see example in table A.3.6.1-4

The S-CSCF forwards the SUBSCRIBE request to the RLS.

Table A.3.6.1-4 SUBSCRIBE request (S-CSCF to RLS)

```
SUBSCRIBE sip:user1 public1@home1.net SIP/2.0
Via: SIP/2.0/UDP scscf1.home1.net;branch=z9hG4bK344a65.1, SIP/2.0/UDP
      pcscfl.visitedl.net;branch=z9hG4bK120f34.1, SIP/2.0/UDP
      [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKehuefdam

Expires:
Accept:
Contact:
Content-Length:
```

P-Charging-Vector: The S-CSCF populates the identifier of its own network to the originating Inter Operator Identifier (IOI) parameter of this header.

P-Charging-Function-Addresses: The S-CSCF populates the P-Charging-Function-Addresses header field to be passed to the RLS.

5. Authorisation

The RLS performs the necessary authorisation checks on the originator to ensure that he/she is authorised to subscribe to xcap-change. In this example this condition has been met, so the RLS sends a 200 (OK) response to the S-CSCF.

6. 200 (OK) response (RLS to S-CSCF) - see example in table A.3.6.1-6

The RLS sends the response to the S-CSCF.

Table A.3.6.1-6: 200 (OK) response (RLS to S-CSCF)

```

21.200 (OK) response (S-CSCF to RLS) – see example in table A.3.6.1-21

The S-CSCF#2 forwards the response to the RLS in the home network of the UE.

Table A.3.6.1-21: 200 (OK) response (S-CSCF to RLS)

A.4 Signalling flows demonstrating how presentities update presence information

A.4.1 Introduction

This subclause covers the signalling flows that show how presentities update presence information in the PS.

A.4.2 Initial publication or modification of presence information by UE

A.4.2.1 Successful publication

Home Network#1

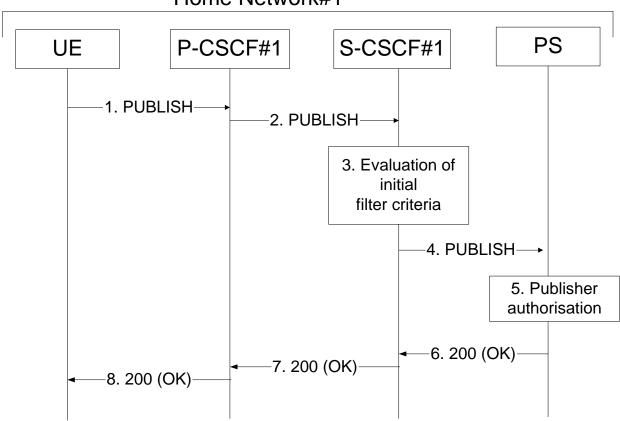

Figure A.4.2.1-1: UE publishing presence information

The UE may publish the partial presence information or the full presence information about a presentity to the PS.

In this example, it is assumed that the UE publishes the full presence information.

Figure A.4.2.1-1 shows a UE publishing or modifying already existing presence information about a presentity. The details of the signalling flows as follows:

1. PUBLISH request (UE to P-CS CF) - see example in table A.4.2.1-1

A PUA in a UE wishes to publish presence information. To initiate the publication, the UE generates a PUBLISH request according to draft-ietf-sip-publish-03 [22] containing the presence information that it wishes to publish.

The message body in the PUBLISH request that carries the publisher's presence update state is formed as indicated in draft-ietf-impp-cpim-pidf-08 [20], draft-ietf-simple-rpid-03 [25], draft-ietf-simple-cipid-01 [31], and draft-ietf-simple-prescaps-ext-00 [24].

   </presence>
```

Request-URI: Public user identity whose presence information the PUA intends to publish.

Event: This field is populated with the value 'presence' to specify the use of the presence package.

To: Same as the Request-URI.

Content-Type: Set to the value 'application/pidf+xml'.

2. PUBLISH request (P-CSCF to S-CSCF) - see example in table A.4.2.1-2

P-CSCF looks up the serving network information for the public user identity that was stored during the registration procedure. The PUBLISH request is forwarded to the S-CSCF. A Route header is inserted into PUBLISH request. The information for the Route header is taken from the service route determined during registration.

Table A.4.2.1-2: PUBLISH request (P-CSCF to S-CSCF)

```
PUBLISH sip:user1 public1@home1.net SIP/2.0
Via: SIP/2.0/UDP pcscfl.homel.net;branch=z9hG4bK240f34.1, SIP/2.0/UDP
      [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKnashds7
P-Access-Network-Info:
Max-Forwards: 69
P-Asserted-Identity: <sip:user1 public1@home1.net>
P-Charging-Vector: icid-value="AyretyU0dm+602IrT5tAFrbHLso=023551024"
Route: <sip:orig@scscfl.homel.net;lr>
From:
To:
Call-ID:
CSeq:
Event:
Expires:
Content-Type:
Content-Length:
```

3. Evaluation of initial filter criteria

S-CSCF validates the service profile of the publisher and evaluates the initial filter criteria. For user1_public1@ho me1.net S-CSCF#1 has originating initial Filter Criteria with Service Points of Interest of Method = PUBLISH AND Event = 'presence' AND To = 'sip:user1_public1@home1.net' that in forms the S-CSCF to route the PUBLISH request to the PS ps.home1.net.

4. PUBLISH (S-CSCF to PS) - see example in table A.4.2.1-4

The S-CSCF#1 forwards the PUBLISH request to the PS.

Table A.4.2.1-4: PUBLISH request (S-CSCF to PS)

```
PUBLISH sip:user1 public1@home1.net SIP/2.0
Via: SIP/2.0/UDP scscf1.home1.net;branch=z9hG4bK351q45.1, SIP/2.0/UDP
      pcscfl.homel.net;branch=z9hG4bK240f34.1, SIP/2.0/UDP
      [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKnashds7
P-Access-Network-Info:
Max-Forwards: 68

A.4.3 Refreshing of presence information by UE

A.4.3.1 Successful refresh

Home Network#1

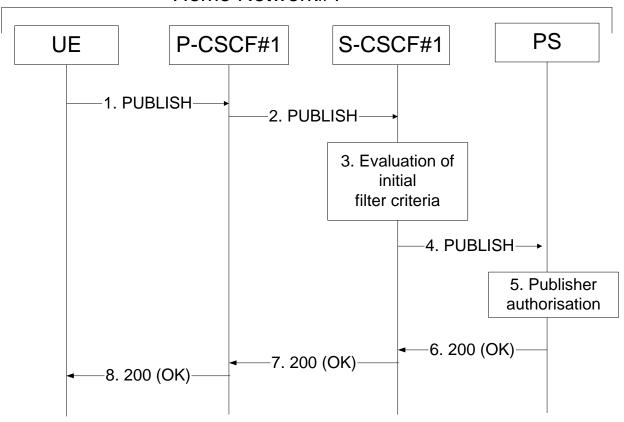

Figure A.4.3.1-1 UE updating presence information

Figure A.4.3.1-1 shows an UE refreshing the presence information about a presentity. The details of the signalling flows as follows:

1. PUBLISH request (UE to P-CSCF) – see example in table A.4.3.1-1

A PUA in a UE wishes to refresh already existing presence information. To initiate the publication, the UE generates a PUBLISH request according to draft-ietf-sip-publish-03 [22].

Table A.4.3.1-1: PUBLISH request (UE to P-CSCF)

```
PUBLISH sip:user1_public1@home1.net SIP/2.0
Via: SIP/2.0/UDP [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKnashds7
Max-Forwards: 70
P-Access-Network-Info: 3GPP-UTRAN-TDD; utran-cell-id-3gpp=234151D0FCE11
Route: <sip:pcscf1.visited1.net:7531;lr;comp=sigcomp>, <sip:orig@scscf1.home1.net;lr>
P-Preferred-Identity: <sip:user1_public1@home1.net>
Privacy: none
From: <sip:user1 public1@home1.net>;tag=31415
To: <sip:user1_public1@home1.net>
Call-ID: b89rjhnedlrfjflslj40a111
CSeq: 61 PUBLISH
Require: sec-agree
Proxy-Require: sec-agree
Security-Verify: ipsec-3gpp; q=0.1; alg=hmac-sha-1-96; spi-c=98765432; spi-s=87654321; port-
      c=8642; port-s=7531
Event: presence
SIP-If-Match: 123xy
Expires: 7200
Content-Length: 0
```

Request-URI: Public user identity whose presence information the PUA intends to publish.

Event: This field is populated with the value 'presence' to specify the use of the presence package.

To: Same as the Request-URI.

SIP-If-Match: This field is populated with the entity-tag earlier provided by the PS in the SIP-ETag header field

of the previous 200(OK) response and isused as a versioning precondition to the PUBLISH

refresh.

2. PUBLISH request (P-CSCF to S-CSCF) – see example in table A.4.3.1-2

P-CSCF looks up the serving network information for the public user identity that was stored during the registration procedure. The PUBLISH request is forwarded to the S-CSCF. A Route header is inserted into PUBLISH request. The information for the Route header is taken from the service route determined during registration.

Table A.4.3.1-2: PUBLISH request (P-CSCF to S-CSCF)

```
PUBLISH sip:user1 public1@home1.net SIP/2.0
Via: SIP/2.0/UDP pcscf1.home1.net;branch=z9hG4bK240f34.1, SIP/2.0/UDP
      [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKnashds7
P-Access-Network-Info:
Max-Forwards: 69
P-Asserted-Identity: <sip:user1 public1@home1.net>
P-Charging-Vector: icid-value="AyretyU0dm+602IrT5tAFrbHLso=023551024"
Route: <sip:orig@scscfl.homel.net;lr>
From:
To:
Call-ID:
CSeq:
Event:
SIP-If-Match:
Expires:
Content-Length:
```

P-Charging-Vector: The P-CSCF populates the icid parameter with a globally unique value.

3. Evaluation of initial filter criteria

S-CSCF#1 validates the service profile of this publisher and evaluates the initial filter criteria. For user1_public1@home1.net the S-CSCF has originating initial Filter Criteria with Service Points of Interest of Method = PUBLISH AND Event = 'presence' AND To = 'sip:user1_public1@home1.net' that in forms the S-CSCF to route the PUBLISH request to the PS ps.home1.net.

4. PUBLISH (S-CSCF to PS) – see example in table A.4.3.1-4

The S-CSCF forwards the PUBLISH request to the PS.

Table A.4.3.1-4: PUBLISH (S-CSCF to PS)

```
PUBLISH sip:user1 public1@home1.net SIP/2.0
Via: SIP/2.0/UDP scscf1.home1.net;branch=z9hG4bK351q45.1, SIP/2.0/UDP
      pcscfl.homel.net;branch=z9hG4bK240f34.1, SIP/2.0/UDP
      [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKnashds7
P-Access-Network-Info:
Max-Forwards: 68
P-Asserted-Identity:

A.5 PS notifying watcher of updates to presence information

A.5.1 Introduction

This subclause covers the signalling flows that show how the PS notifies watchers of updates to presence information.

A.5.2 Watcher and presentity in the different networks, UE in the home network

A.5.2.1 Successful notification

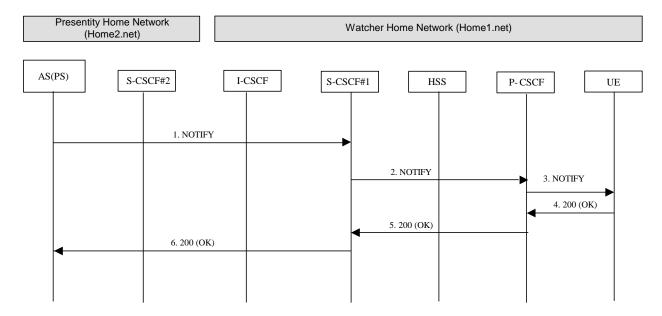

Figure A.5.2.1-1: Notification to watcher in the visited network

Figure A.5.2.1-1 shows how a watcher is notified of updates to a presentity's presence information. The signalling flow is applicable to the case where the watcher and presentity are in the same or in different IM CN subsystems.

1. NOTIFY request (PS to S-CSCF) – see example in table A.5.2.1-1

The PS determines which authorised watchers are entitled to receive the updates of the presence information for this presentity. For each appropriate watcher, the PS sends a NOTIFY request that contains the updated state of presence information. The NOTIFY request may either contain the complete set of presence information, or only the information that has changed since the last notification. In this example, the watcher indicated preference for partial notification in the SUBSCRIBE request, so the NOTIFY request is formulated according to draft-ietf-simple-partial-notify-01 [23] and draft-ietf-simple-partial-pidf-format-00 [37] by including only the information that has changed since the last notification.

Table A.5.2.1-1: NOTIFY request (PS to S-CSCF)

```
NOTIFY sip: [5555::aaa:bbb:ccc:ddd]:1357; comp=sigcomp SIP/2.0
Via: SIP/2.0/UDP ps.home2.net; branch=z9hG4bK240f34.1

```

P-Charging-Vector: The S-CSCF stores the originating Inter Operator Identifier (IOI) parameter.

P-Charging-Function-Addresses: The S-CSCF populates the P-Charging-Function-Addresses header field to be passed to the P-CSCF.

3. NOTIFY request (P-CS CF to UE) – see example in table A.5.2.1-3

The P-CSCF forwards the NOTIFY request to the UE.

Table A.5.2.1-3: NOTIFY request (P-CSCF to UE)

4. 200 (OK) response (UE to P-CSCF) – see example in table A.5.2.1-4

The UE acknowledges the NOTIFY request with a 200 (OK) response to the P-CSCF.

Table A.5.2.1-4: 200 (OK) response (UE to P-CSCF)

5. 200 (OK) response (P-CSCF to S-CSCF) – see example in table A.5.2.1-5

The P-CSCF forwards the 200 (OK) response to the S-CSCF.

Table A.5.2.1-5: 200 (OK) response (P-CSCF to S-CSCF)

6. 200 (OK) response (S-CSCF to PS) – see example in table A.5.2.1-6

The S-CSCF forwards the 200 (OK) response to the PS.

Table A.5.2.1-6: 200 (OK) response (S-CSCF to PS)

P-Charging-Vector: The S-CSCF inserts the originating Inter Operator Identifier (IOI) parameter and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.

A.5.3 Notification to resource list in a different network and notification to watcher in the visited network

A.5.3.1 Successful notification

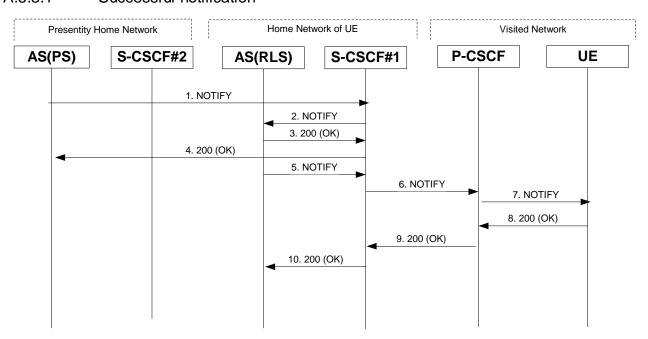

Figure A.5.3.1-1: Notification to resource list in a different network and notification to watcher in the visited network

Figure A.5.3.1-1 shows the PS providing presence event notification about a presentity to a RLS in a different network. This notification triggers the RLS to provide presence event notification to the watcher. The details of the signalling flows are as follows:

1. NOTIFY request (PS to S-CSCF) – see example in table A.5.3.1-1

The PS determines which authorised watchers are entitled to receive presence information. For each appropriate watcher, the PS sends a NOTIFY request that contains the updated state of presence information. In this example the notification is only sent to the RLS.

The NOTIFY request may either contain the complete set of presence information, or only those presence tuples that have changed since the last notification. For this example, the complete set of presence information is sent.

Table A.5.3.1-1: NOTIFY request (PS to S-CSCF)

```

- **P-Charging-Vector:** The PS populates the icid parameter with a globally unique value and populates the identifier of its own network to the originating Inter Operator Identifier (IOI) parameter of this header.
- **P-Charging-Function-Addresses**: The PS populates the P-Charging-Function-Addresses header field to be passed to the S-CSCF.
- 2. NOTIFY request (S-CSCF to RLS) see example in table A.5.3.1-2

The S-CSCF#1 forwards the NOTIFY request to the RLS.

Table A.5.3.1-2: NOTIFY request (S-CSCF to RLS)

- **P-Charging-Vector:** The S-CSCF stores the originating Inter Operator Identifier (IOI) parameter and populates the identifier of its own network to the originating Inter Operator Identifier (IOI) parameter of this header.
- **P-Charging-Function-Addresses**: The S-CSCF stores the P-Charging-Function-Addresses header field and passes this header to the RLS.
- 3. 200 (OK) response (RLS to S-CSCF) see example in table A.5.3.1-3

The RLS generates a 200 (OK) response to the NOTIFY request.

Table A.5.3.1-3: 200 (OK) response (RLS to S-CSCF)

- **P-Charging-Vector:** The RLS stores the terminating Inter Operator Identifier (IOI) parameter and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.
- 4. 200 (OK) response (S-CSCF to PS) see example in table A.5.3.1-4

The S-CSCF#1 forwards the 200 (OK) response to the PS.

Table A.5.3.1-4: 200 (OK) response (S-CSCF to PS)

P-Charging-Vector: The S-CSCF stores the terminating Inter Operator Identifier (IOI) parameter and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.

5. NOTIFY request (RLS to S-CS CF#1) – see example in table A.5.3.1-5

The RLS may decide to wait for other notifications and combine them in a single notification towards the UE or it sends the notification to the UE without any waiting. In this example, the RLS does not wait for other notifications.

Table A.5.3.1-5: NOTIFY request (RLS to S-CSCF)

8. 200 (OK) response (UE to P-CSCF) – see example in table A.5.3.1-8

The UE acknowledges the NOTIFY request with a 200 (OK) response to the P-CSCF.

Table A.5.3.1-8: 200 (OK) response (UE to P-CSCF)

9. 200 (OK) response (P-CSCF to S-CSCF) – see example in table A.5.3.1-9

The P-CSCF forwards the 200 (OK) response to the S-CSCF.

Table A.5.3.1-9: 200 (OK) response (P-CSCF to S-CSCF)

10. 200 (OK) response (S-CSCF to RLS) – see example in table A.5.3.1-10

The S-CSCF forwards the response to the RLS in the home network of the presentity.

Table A.5.3.1-10: 200 (OK) response (S-CSCF to RLS)

- **P-Charging-Vector:** The S-CSCF stores the terminating Inter Operator Identifier (IOI) parameter and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.
- **P-Charging-Function-Addresses**: The S-CSCF stores the P-Charging-Function-Addresses header field and passes this header to the RLS.

A.6 PUA subscribing to his own watcher list and receiving notification of new watcher subscriptions

A.6.1 Introduction

This subclause covers the signalling flows that show how a PUA can subscribe to his own watcher list.

A.6.2 PUA subscribing to watcher list and receiving a notification of an already pending watcher subscription followed by a notification of a subscription from a new watcher not already in the watcher list

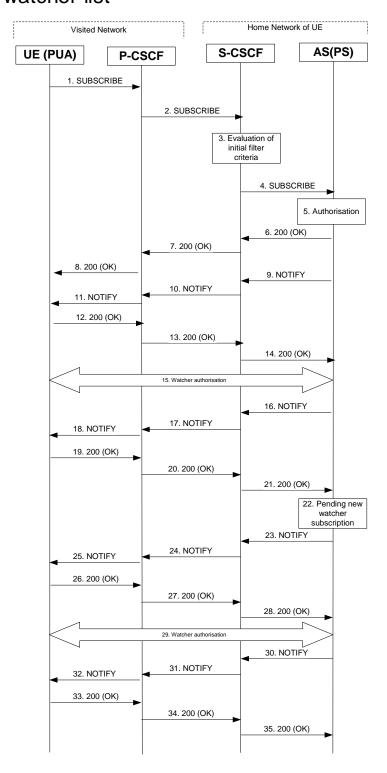

Figure A.6.2-1: PUA subscribing to watcher list and receiving a notification of an already pending watcher subscription followed by a notification of a subscription from a new watcher not already in the watcher list

Figure A.6.2-1 shows a PUA subscribing to watcher list and receiving a notification of an already pending watcher subscription followed by a notification of a subscription from a new watcher not already in the watcher list. In this example a partial state watcher-info document is transported in the notify for the second watcher subscription. The details of the signalling flows as follows:

1. SUBSCRIBE request (UE to P-CSCF) – see example in table A.6.2-1

The presentity wishes to watch his own watcher information, therefore he subscribes for the watcher information template-package of presence. The UE generates a SUBSCRIBE request containing the presence winfo event, together with an indication of the length of time this periodic subscription should last.

Table A.6.2-1: SUBSCRIBE request (UE to P-CSCF)

```
SUBSCRIBE sip:user1 public1@home1.net SIP/2.0
Via: SIP/2.0/UDP [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKehuefdam
Max-Forwards: 70

```

Request URI: Public user identity whose events the subscriber subscribes to. In this case the Public User Identity

of the presentity in SIP URI format.

Event: This field is populated with the value 'presence.winfo' to specify the use of the watcher

information template-package of presence.

Accept: This field is populated with the value 'application/watcherinfo+xml' indicating that the UE

supports this body type for notification.

To: Same as the Request-URI.

2. SUBSCRIBE request (P-CSCF to S-CSCF) – see example in table A.6.2-2

The P-CSCF looks up the serving network information for the public user identity that was stored during the registration procedure. The SUBSCRIBE request is forwarded to the S-CSCF. A Route header is inserted into SUBSCRIBE request.

Table A.6.2-2: SUBSCRIBE request (P-CSCF to S-CSCF)

```
SUBSCRIBE sip:user1 public1@home1.net SIP/2.0
Via: SIP/2.0/UDP pcscf1.visited1.net;branch=z9hG4bK120f34.1 ,SIP/2.0/UDP

3. Evaluation of initial filter criteria

The S-CSCF validates the service profile of this subscriber and evaluates the initial filter criteria. For sip:user1_public1@home1.net the S-CSCF has originating initial Filter Criteria with Service Point Trigger of Method = SUBSCRIBE AND Event = 'presence.winfo' that informs the S-CSCF to route the SUBSCRIBE request to the Application Server sip:ps.home1.net.

4. SUBSCRIBE request (S-CS CF to PS) – see example in table A.6.2-4

The S-CSCF forwards the SUBSCRIBE request to the PS.

Table A.6.2-4: SUBSCRIBE request (S-CSCF to PS)

```
SUBSCRIBE sip:user1_public1@home1.net SIP/2.0
Via: SIP/2.0/UDP scscf1.home1.net;branch=z9hG4bK344a65.1, SIP/2.0/UDP
      pcscfl.visitedl.net;branch=z9hG4bK120f34.1, SIP/2.0/UDP
      [5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp;branch=z9hG4bKehuefdam
P-Access-Network-Info:
Max-Forwards: 68

```

P-Charging-Vector: The S-CSCF inserts the originating Inter Operator Identifier (IOI) parameter received and populates the identifier of its own network to the originating Inter Operator Identifier (IOI) parameter of this header.

P-Charging-Function-Addresses: The S-CSCF stores the P-Charging-Function-Addresses header field and passes this header to the PS.

5. Authorisation

The PS performs the necessary authorisation checks on the originator. In this example, the originator is the owner of the watcher information, so he/she is authorised to see the full watcher information.

In other examples (when the originator is not the owner of the watcher information) subscribers are only allowed to monitor the state of their own subscription, which means that they will receive notifications only containing the state of their own subscription.

6. 200 (OK) response (PS to S-CSCF) - see example in table A.6.2-6

The PS sends the response to the S-CSCF.

Table A.6.2-6: 200 (OK) response (PS to S-CSCF)

```

- **P-Charging-Vector:** The S-CSCF passes this header received.
- **P-Charging-Function-Addresses**: The S-CSCF stores the P-Charging-Function-Addresses header field and passes this header to the P-CSCF.
- 18. NOTIFY request (P-CS CF to UE) see example in table A.6.2-18

The P-CSCF forwards the NOTIFY request to the PUA in the UE.

Table A.6.2-18: NOTIFY request (P-CSCF to UE)

19. 200 (OK) response (UE to P-CSCF) – see example in table A.6.2-19

The PUA determines that this is a full state watcher-info document and replaces any current watcher-info with the new document. The UE acknowledges the NOTIFY request with a 200 (OK) response to the P-CSCF.

Table A.6.2-19: 200 (OK) response (UE to P-CSCF)

20. 200 (OK) res ponse (P-CSCF to S-CSCF) – see example in table A.6.2-20

The P-CSCF forwards the 200 (OK) response to the S-CSCF.

Table A.6.2-20: 200 (OK) response (P-CSCF to S-CSCF)

21. 200 (OK) response (S-CSCF to PS) – see example in table A.6.2-21

The P-CSCF forwards the response to the PS in the home network of the UE.

Table A.6.2-21: 200 (OK) response (S-CSCF to PS)

P-Charging-Vector: The PS inserts the originating Inter Operator Identifier (IOI) parameter received and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.

22. Pending new watcher subscription

The PS receives a SUBSCRIBE request from a new watcher and performs the necessary authorisation checks on the originator and determines that this is a new watcher that is not yet in the watcher list.

23. NOTIFY request (PS to S-CSCF) – see example in table A.6.2-23

The PS generates a NOTIFY request containing the current state of the watcher information. The watcher information contains one pending subscription. Partial state is used for the watcher-info document transported in this subsequent notification.

Table A.6.2-23 NOTIFY request (PS to S-CSCF)

```
NOTIFY sip:[5555::aaa:bbb:ccc:ddd]:1357;comp=sigcomp SIP/2.0

P-Charging-Vector: The S-CSCF stores the originating Inter Operator Identifier (IOI) parameter received.

P-Charging-Function-Addresses: The S-CSCF stores the P-Charging-Function-Addresses header field and passes this header to the P-CSCF.

25. NOTIFY request (P-CS CF to UE) – see example in table A.6.2-25

The P-CSCF forwards the NOTIFY request to the PUA in the UE.

Table A.6.2-25: NOTIFY request (P-CSCF to UE)

26. 200 (OK) response (UE to P-CSCF) – see example in table A.6.2-26

The PUA determines that this is a partial state notification of watcher-info and adds the new pending subscription to its existing watcher-info document. The UE acknowledges the NOTIFY request with a 200 (OK) response to the P-CSCF.

Table A.6.2-26: 200 (OK) response (UE to P-CSCF)

27. 200 (OK) response (P-CSCF to S-CSCF) – see example in table A.6.2-27

The P-CSCF forwards the 200 (OK) response to the S-CSCF.

Table A.6.2-27: 200 (OK) response (P-CSCF to S-CSCF)

28. 200 (OK) response (S-CSCF to PS) – see example in table A.6.2-28

The P-CSCF forwards the response to the PS in the home network of the UE.

Table A.6.2-28: 200 (OK) response (S-CSCF to PS)

P-Charging-Vector: The S-CSCF insertes the originating Inter Operator Identifier (IOI) parameter received and populates the identifier of its own network to the terminating Inter Operator Identifier (IOI) parameter of this header.

29. Authorisation of watcher

The presentity determines to allow the watcher to access the presence information. The PUA modifies the authorisation policy by authorising presence information for sip:user3_public1@home3.net.

30. NOTIFY request (PS to S-CSCF) – see example in table A.6.2-30

The authorisation event means changes in the watcher information, which triggers a new NOTIFY request. The watcher information included in the NOTIFY request contains the accepted subscription of sip:user3_public1@home3.net.

Table A.6.2-30 NOTIFY request (PS to S-CSCF)

```
NOTIFY sip: [5555::aaa:bbb:ccc:ddd]:1357; comp=sigcomp SIP/2.0

A.7 PNA subscription for the reg-event package

Figure A.7-1 shows the registration signalling flow for the scenario when the user is not registered. For the purpose of this registration signalling flow, the subscriber is considered to be roaming. This flow also shows the authentication of the private user identity.

This is followed by the subscription procedure for the reg-event package, whereby the PNA requests to be notified by the S-CSCF when a registration event has occurred. This is done using the 'reg-event' package as described in 3GPP TS 24.229 [16].

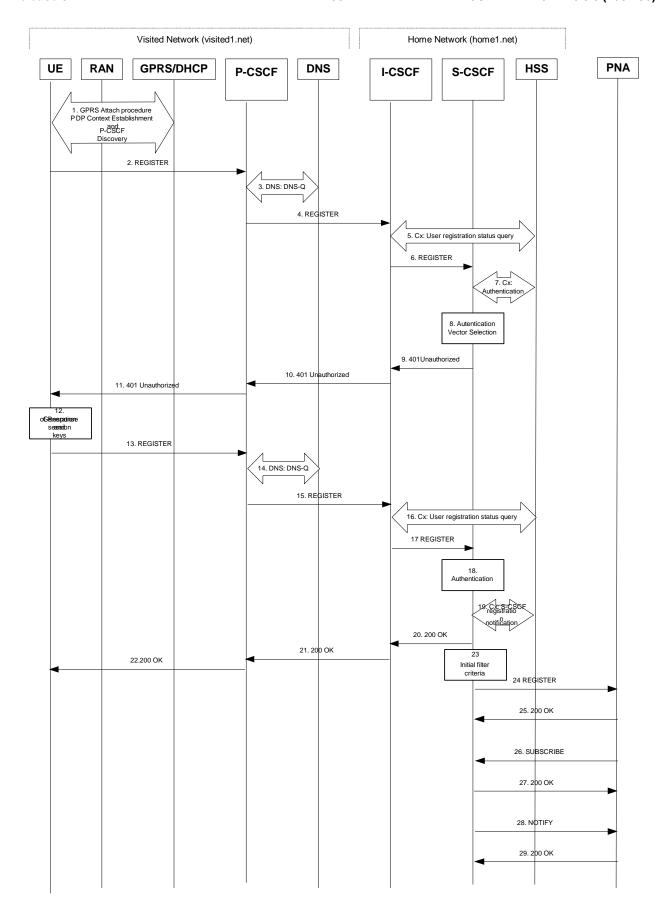

Figure A.7-1: Registration signalling: user not registered

1-22. See 3GPP TS 24.228 [4] subclause 6.2 steps 1 through 22

23. Initial filter criteria

The S-CSCF analyses the incoming request against the initial filter criteria and decides to send a third-party REGISTER request to the PNA.

24. REGISTER request (S-CSCF to PNA) - see example in table A.7-24

This signalling flow forwards the REGISTER request from the S-CSCF to the PNA.

Table A.7-24: REGISTER request (S-CSCF to PNA)

```

```

26. SUBSCRIBE request (PNA to S-CSCF) - see example in table A.7-26

The PNA sends the SUBSCRIBE request for the reg event package.

Table A.7-26: SUBSCRIBE request (PNA to S-CSCF)

```
SUBSCRIBE sip:user1_public1@home1.net SIP/2.0
Via: SIP/2.0/UDP sip:ps.home1.net
Max-Forwards: 70
P-Asserted-Identity: <sip:ps.home1.net>
Privacy: none
From: <sip:ps.home1.net>; tag=31415
To: <sip:user1_public1@home1.net>
Call-ID: dre36d2v32gnlgiiomm72445
CSeq: 61 SUBSCRIBE
Event: reg
Expires: 600000
Accept: application/reginfo+xml
Contact: <sip:ps.home1.net>
Content-Length: 0
```

From: This header is populated with the SIP URI that identifies the PNA.

Contact: This is where the NOTIFY requests for this subscription will be sent.

Event: This field is set to the value 'reg' to specify the use of the reg event package.

Accept: This field is set to the value "application/reginfo+xml".

27. 200 (OK) response (S-CSCF to PNA) - see example in table A.7-27

The S-CSCF sends a 200 (OK) response to the PNA indicating that registration was successful.

Table A.7-27: 200 (OK) response (S-CSCF to PNA)

```
SIP/2.0 200 OK
Via: SIP/2.0/UDP sip:ps.homel.net
P-Asserted-Identity: <sip:scscf1.homel.net>
Privacy:
From:
To: <sip:user1_public1@homel.net>;tag=151170
Call-ID:
CSeq:
Contact: <sip:scscf1.homel.net>
Expires:
Content-Length:
```

Expires: If value of the Expires header in SUBSCRIBE request is different from the one received in REGISTER method, then the value of Expires header in the 200 (OK) response is set to match the value of Expires header in REGISTER method.

28. NOTIFY request (S-CSCF to PNA) - see example in table A.7-28

The S-CSCF sends a first NOTIFY request towards the PNA in order to inform the PNA about the registration status of monitored user.

Table A.7-28: NOTIFY request (S-CSCF to PNA)

```
NOTIFY sip:pcscfl.visited1.net SIP/2.0
Via: SIP/2.0/UDP scscfl.homel.net;branch=z9hG4bK332b23.1
Max-Forwards: 70
From: <sip:user1 public1@home1.net>;tag=151170
To: <sip:user1 public1@pcscf1.visited1.net>;tag=31415
Call-ID: dre36\overline{d}2v32gnlgiiomm72445
CSeq: 42 NOTIFY
Subscription-State: active; expires=600000
Event: reg
Content-Type: application/reginfo+xml
Contact: <sip:scscfl.homel.net>
Content-Length: (...)
<?xml version="1.0"?>
<reginfo xmlns="urn:ietf:params:xml:ns:reginfo"</pre>
                version="1" state="full">
     <registration aor="sip:user1 public1@home1.net" id="a7" state="active">
         <contact id="76" state="active" event="registered">
             <uri>sip:[5555::aaa:bbb:ccc:ddd]</uri>
         </contact>
     </registration>
     <registration aor="sip:user1 public2@home1.net" id="a8" state="active">
         <contact id="77" state="active" event="created">
             <uri>sip:[5555::aaa:bbb:ccc:ddd]</uri>
         </contact>
     </registration>
     <registration aor="tel:+358504821437" id="a9" state="active">
         <contact id="78" state="active" event="created">
             <uri>sip:[5555::aaa:bbb:ccc:ddd]</uri>
         </contact>
     </registration>
</reginfo>
```

From: The tag of this field matches that of the To; field in the received 200 (OK) response for the SUBSCRIBE request.

Content-Type: Set to the value of the Accept header received in the SUBSCRIBE request or "application/reginfo+xml" if the Accept header was not present in the SUBSCRIBE request.

The message body in the NOTIFY request that carries the subscriber's registration state is formed as indicated in 3GPP TS 24.229 [16].

29.200 (OK) response (PNA to S-CSCF) - see example in table A.7-29

PNA sends the 200 (OK) response to the S-CSCF.

Table A.7-29: 200 (OK) response (PNA to S-CSCF)

```
SIP/2.0 200 OK
Via: SIP/2.0/UDP scscf1.home1.net;branch=z9hG4bK332b23.1

A.8 Example signalling flows of HTTP based presence service operation

A.8.1 Introduction

This subclause shows signalling flows relating to the manipulation of presence service data over the Ut reference point using XCAP.

Each example signalling flow shows several sequences of manipulation of data for the presence service.

NOTE: Error conditions are not considered in the examples e.g. if authorisation checks fail in the XCAP server, XML Schema compliancy checks fail or the file specified by the URI does not exist then an appropriate 4xx response is sent to the client.

Editor's note: Clarifications how XCAP is using HTTP is needed.

A.8.2 Signalling flows demonstrating how DMs manipulate resource lists

Editor's Note: The possible proxies (e.g., handling authentication matters) between the data manipulator client and HTTP server are bypassed. Also the authentication related headers are missing.

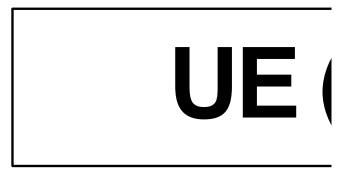

Figure A.8.2-1: DM manipulating a resource list on DMS

Figure A.8.2-1 shows a how a DM may manipulate a resource list on a DMS. The details of the signalling flows are as follows:

1. XCAP PUT request (DM to DMS - see example in table A.8.2-1

The DM generates an XCAP PUT request to create a new resource list on the DMS. The resource list has one entry.

Table A.8.2-1: XCAP PUT request (DM to DMS)

2. XCAP 201 (Created) response (DMS to DM) – see example in table A.8.2-2

After the DMS has performed the necessary authorisation checks on the originator to ensure the DM is allowed to create a file, the DMS sends an XCAP 201 (Created) response to the DM.

Table A.8.2-1: XCAP 201 (Created) response (DMS to DM)

```
HTTP/1.1 201 CREATED
Server: Apache/1.3.22 (Unix) mod_perl/1.27
```

```
Date: Thu, 08 Jan 2004 10:50:35 GMT
Content-Type: text/html
Content-Length: 0
```

3. XCAP PUT request (DM to DMS) – see example in table A.8.2-3

The DM adds a new entry to the previously created resource list by generating a new XCAP PUT request.

Table A.8.2-3: XCAP PUT request (DM to DMS)

4. XCAP 200 (OK) response (DMS to DM) – see example in table A.8.2-4

After the DMS has performed the necessary authorisation checks, XML document validations and XML schema compliancy checks the DMS sends an XCAP 201 (Created) response to the DM.

Table A.8.2-4: XCAP 200 (OK) response (DMS to DM)

```
HTTP/1.1 200 OK
Server: Apache/1.3.22 (Unix) mod_perl/1.27
Date: Thu, 08 Jan 2004 10:50:45 GMT
Content-Type: text/html
Content-Length: 0
```

5. XCAP DELETE request (DM to DMS) – see example in table A.8.2-5

The DM decides to delete the entry "user2" from the resource list. The DM generates an XCAP DELETE request.

Table A.8.2-5: XCAP DELETE request (DM to DMS)

```
DELETE http://xcap.home1.net/services/resource-lists/users/user1/pf.xml?resource-lists/list[@name="Presence_fellows"]/entry[@name=user2"] HTTP/1.1
Host: oper.example.com:9999
User-Agent: IMS subscriber
Date: Thu, 08 Jan 2004 10:14:17 GMT
Referer: http://oper.home1.net:1234/service
```

6. XCAP 200 (OK) response (DMS to DM) - see example in table A.8.2-6

After the DMS has performed the necessary authorisation checks on the originator to ensure the DM is allowed to delete an entry from the resource list, the DMS sends an XCAP 200 (OK) response.

Table A.8.2-6: XCAP 200 (OK) response (DMS to DM)

```
HTTP/1.1 200 OK
Server: Apache/1.3.22 (Unix) mod_perl/1.27
Date: Thu, 08 Jan 2004 11:00:47 GMT
Content-Type: image/jpeg
Content-Length: 0
```

7. XCAP GET request (DM to DMS) – see example in table A.8.2-7

The DM wishes to check the result of the previous transaction by generating an XCAP GET request.

Table A.8.2-7: XCAP GET request (DM to DMS)

```
GET http://xcap.homel.net/services/resource-lists/users/user1/pf.xml HTTP/1.1
User-Agent: IMS subscriber
Referer: http://oper.homel.net:1234/service
Date: Thu, 08 Jan 2004 11:13:17 GMT
Content-Length: 0
```

8. XCAP 200 (OK) response (DMS to DM) – see example in table A.8.2-8 $\,$

After the DMS has performed the necessary authorisation checks on the originator to ensure the DM is allowed to fetch the resource list, the DMS sends an XCAP 200 (OK) response to the DM including the resource list in the body of the response.

Table A.8.2-8: XCAP 200 (OK) response (DMS to DM)

A.8.3 Signalling flows demonstrating how DMs manipulate presence authorization policy

Editor's Note: The possible proxies (e.g., handling authentication matters) between the data manipulator client and HTTP server are bypassed. Also the authentication related headers are missing.

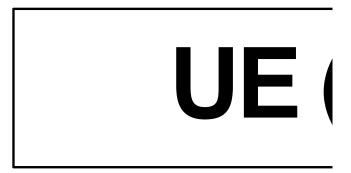

Figure A.8.3-1: DM manipulating presence authorization policy on DMS

Figure A.8.3-1 shows a DM manipulating presence authorization policy on a DMS. The details of the signalling flows are as follows:

1. XCAP PUT request (DM to DMS) – see example in table A.8.3-1

The DM generates an XCAP PUT request to create a presence authorization policy on the DMS. The presence authorization policy has one permission statement allowing for sip:user2_public1@home2.net to see all information from the basic PIDF namespace along with the "video" element from the prescaps namespace.

Table A.8.3-1: XCAP PUT request (DM to DMS)

```
PUT http://xcap.homel.net/services/permission-statements/users/user1/ps.xml HTTP/1.1
User-Agent: IMS subscriber
Referer: http://oper.home1.net:1234/service
Date: Thu, 08 Jan 2004 10:13:17 GMT
Content-Type:application/permission-statements+xml
Content-Length: (...)
<?xml version="1.0" encoding="UTF-8"?>
   <permission-statements xmlns="urn:ietf:params:xml:ns:permission-statements"</pre>
    xmlns:pidf="urn:ietf:params:xml:ns:pidf"
    xmlns:prescaps="urn:ietf:params:xml:ns:simple-prescaps-ext">
     <statement id="dsafa43232">
       <applies-to>
         <uri>sip:user2 public1@home2.net</uri>
       </applies-to>
       <permissions>
         <accept/>
         <show-namespace>urn:ietf:params:xml:ns:pidf</show-namespace>
         <show-element>prescaps:video</show-element>
    </statement>
   </permission-statements>
```

2. XCAP 201 (Created) response (DMS to DM) – see example in table A.8.3-2

After the DMS has performed the necessary authorisation checks on the originator to ensure the DM is allowed to create a file, the DMS sends an XCAP 201 (Created) response to the DM.

Table A.8.3-2: XCAP 201 (Created) response (DMS to DM)

```
HTTP/1.1 201 CREATED
Server: Apache/1.3.22 (Unix) mod_perl/1.27
Date: Thu, 08 Jan 2004 10:50:35 GMT
Content-Type: text/html
Content-Length: 0
```

3. XCAP PUT request (DM to DMS) – see example in table A.8.3-3

The DM adds a new permission-statement to the previously created presence authorization policy by generating a new XCAP request. The new permission statement allows the user named sip:user3_public1@home3.net to see the tuple with class element specifying "sip".

Table A.8.3-3: XCAP PUT request (DM to DMS)

```
PUT http://xcap.homel.net/services/permission-statements/users/user1/ps.xml/permission-
      statements HTTP/1.1
User-Agent: IMS subscriber
Referer: http://oper.home1.net:1234/service
Date: Thu, 08 Jan 2004 10:13:27 GMT
Content-Type: application/xml-fragment-body
Content-Length: (...)
<?xml version="1.0" encoding="UTF-8"?>
    <statement id="dsffdsfrrr32423">
       <applies-to>
         <uri>sip:user3 public1@home3.net</uri>
       </applies-to>
       <permissions>
         <accept/>
         <show-tuple>sip</show-tuple>
       </permissions>
     </statement>
```

4. XCAP 200 (OK) response (DMS to DM) – see example in table A.8.3-4

After the DMS has performed the necessary authorisation checks, XML document validations and XML schema compliancy checks the DMS sends an XCAP 201 (Created) response to the DM.

Table A.8.3-4: XCAP 200 (OK) response (DMS to DM)

```
HTTP/1.1 200 OK
Server: Apache/1.3.22 (Unix) mod_perl/1.27
Date: Thu, 08 Jan 2004 10:50:45 GMT
Content-Type: text/html
Content-Length: 0
```

5. XCAP DELETE request (DM to DMS) – see example in table A.8.3-5

The DM decides to delete the permission-statement for sip:user2_public1@home2.net from the authorization policy. The DM generates an XCAP DELETE request.

Table A.8.3-5: XCAP DELETE request (DM to DMS)

```
DELETE http://xcap.home1.net/services/presence-lists/users/user1/ps.xml/permission-statements/statement[@id="dsafa43232"]/permissions/show-namespace HTTP/1.1

Host: oper.example.com:9999
User-Agent: IMS subscriber
Date: Thu, 08 Jan 2004 10:14:17 GMT
```

```
Referer: http://oper.home1.net:1234/service
```

6. XCAP 200 (OK) response (DMS to DM) – see example in table A.8.3-6

After the DMS has performed the necessary authorisation checks on the originator to ensure the DM is allowed to delete an entry from the resource list, the DMS sends an XCAP 200 (OK) response.

Table A.8.3-6: XCAP 200 (OK) response (DMS to DM)

```
HTTP/1.1 200 OK
Server: Apache/1.3.22 (Unix) mod_perl/1.27
Date: Thu, 08 Jan 2004 11:00:47 GMT
Content-Length: 0
```

7. XCAP GET request (DM to DMS) – see example in table A.8.3-7

The DM wishes to check the result of the previous transaction by generating an XCAP GET request.

Table A.8.3-7: XCAP GET request (DM to DMS)

```
GET http://xcap.homel.net/services/permission-statements/users/user1/ps.xml HTTP/1.1
User-Agent: IMS subscriber
Referer: http://oper.homel.net:1234/service
Date: Thu, 08 Jan 2004 11:13:17 GMT
Content-Length: 0
```

8. XCAP 200 (OK) response (DMS to DM) – see example in table A.8.3-8

After the DMS has performed the necessary authorisation checks on the originator to ensure the DM is allowed to fetch the resource list, the DMS sends an XCAP 200 (OK) response to the DM including the resource list in the body of the response.

Table A.8.3-8: XCAP 200 (OK) response (DMS to DM)

```
HTTP/1.1 200 OK
Server: Apache/1.3.22 (Unix) mod_perl/1.27
Etag: "eiuuekksks"
Date: Thu, 08 Jan 2004 11:50:35 GMT
Content-Type:application/permission-statements+xml
Content-Length: (...)
<?xml version="1.0" encoding="UTF-8"?>
   <permission-statements xmlns="urn:ietf:params:xml:ns:permission-statements"</pre>
     xmlns:pidf="urn:ietf:params:xml:ns:pidf"
     xmlns:prescaps=" urn:ietf:params:xml:ns:simple-prescaps-ext">
     <statement id="dsffdsfrrr32423">
       <applies-to>
         <uri>sip:user3 public1@home3.net</uri>
       </applies-to>
       <permissions>
         <accept/>
         <show-tuple>sip</show-tuple>
       </permissions>
     </statement>
   </permission-statements>
```

A.8.4 Storing external content (successful operation)

Editor's Note: The possible proxies (e.g., handling authentication matters) between the data manipulator client and HTTP server are bypassed. Also the authentication related headers are missing.

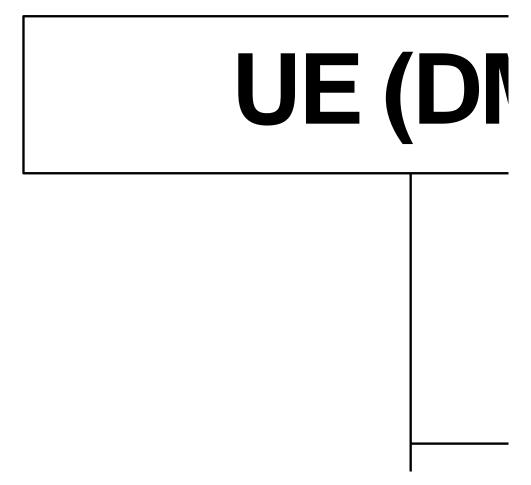

Figure A.8.4.-1: DM manipulating hard-state presence document on DMS

Figure A.8.4-1 shows a DM manipulating hard-state presence document on a DMS when the presence document has an aggregated storing MIME object with the "application/pidf+xml" content type and any of its extensions. The details of the signalling flows are as follows:

1. HTTP PUT request (DM (client) to DMS) – see example in table A.8.2-1

In order to store the content, the DM generates an HTTP PUT request containing the MIME object in the body of the request. The request-URI points to the directory where the content is stored and shows the name of the file to be created.

Table A.8.4-1: HTTP PUT request (DM to DMS)

```
PUT http://operator.example.com/services/users/bill/pictureX HTTP/1.1
User-Agent: IMS subscriber
Referer: http://oper.home1.net:1234/service
Date: Thu, 08 Jan 2004 10:13:17 GMT
Content-Type: image/jpeg
Content-Length: (...)
{pictureX.jpg}
```

2. HTTP 201 (Created) response (DMS to DM) – see example in table A.8.4-2

After the DMS has performed the necessary authorisation checks on the originator to ensure the DM is allowed to create a file the HTTP server sends an HTTP 201 (Created) response to the client.

Table A.8.4-2: HTTP 201 (Created) response (DMS to DM)

```
HTTP/1.1 201 CREATED
Server: Apache/1.3.22 (Unix) mod_perl/1.27Content-Type: text/html
Date: Thu, 08 Jan 2004 10:50:35 GMT
Content-Length: 1234
```

3. XCAP PUT request (DM to DMS) – see example in table A.8.2-3

The DM generates an XCAP PUT request in order to store XML encoded presence document which includes a URI reference to the MIME object stored on the DMS. The AUID part of the request URI is 'pidf-manipulation' as defined in draft-isomaki-simple-xcap-pidf-manipulation-usage-00 [33].

Table A.8.4-3: XCAP PUT request (DM to DMS)

```
PUT http://xcap.example.com/services/pidf-manipulation/users/bill/pidf.xml HTTP/1.1
User-Agent: IMS subscriber
Referer: http://xcap.home1.net:1234/service
Date: Thu, 08 Jan 2004 10:13:27 GMT
Content-Type: application/pidf+xml
Content-Length: (...)
<?xml version="1.0" encoding="UTF-8"?>
   cpresence xmlns="urn:ietf:params:xml:ns:cpim-pidf"
          xmlns:et="urn:ietf:params:xml:ns:pidf:rpid-tuple"
          xmlns:ext="urn:ietf:params:xml:ns:ext-cont"
          entity="sip:bill@example.com">
     <tuple id="123sd">
       <status>
         <basic>open
       </status>
       <et:type>service</et:type>
         <contact>sip:bill@example.com</contact>
     </tuple>
     <tuple id="432sd">
       <status>
         <basic>open
       </status>
       <et:type>presentity</et:type>
       <ext:photo>
         http://operator.example.com/services/users/bill/pictureX.jpg
       </ext:photo>
       <note xml:lang="en">At home</note>
     </tuple>
   sence>
```

4. XCAP 201 (CREATED) response (DMS to DM) – see example in table A.8.4-4

After the DMS has performed the necessary authorisation checks, XML document validations and XML schema compliancy checks the DMS sends an XCAP 201 (Created) response to the DM.

Table A.8.4-4: XCAP 201 (Created) response (DMS to DM)

```
HTTP/1.1 201 CREATED
Server: Apache/1.3.22 (Unix) mod_perl/1.27
Date: Thu, 08 Jan 2004 10:50:45 GMT
Content-Length: 0
```

5. HTTP GET request (DM to DMS) – see example in table A.8.4-5

The DM wishes to fetch the MIME object from the DMS. The client generates an HTTP GET request. The request URI points to the directory where the object is stored and indicates the name of the file to be fetched.

Table A.8.4-5: HTTP GET request (DM to DMS)

```
GET http://operator.example.com/services/users/bill/pictureX HTTP/1.1
Host: oper.example.com:9999
User-Agent: IMS subscriber
Date: Thu, 08 Jan 2004 10:43:17 GMT
Accept: image/jpeg
Referer: http://oper.home1.net:1234/service
```

6. HTTP 200 (OK) response (DMS to DM) - see example in table A.8.4-6

After the DMS has performed the necessary authorisation checks on the originator to ensure the DM is allowed to fetch the file the DMS sends an HTTP 200 (OK) response having the object in the body to the DM.

Table A.8.4-6: HTTP 200 (OK) response (DMS to DM)

```
HTTP/1.1 200 OK
Server: Apache/1.3.22 (Unix) mod_perl/1.27
Date: Thu, 08 Jan 2004 11:00:47 GMT
Content-Type: image/jpeg
Content-Length: (...)
{pictureX}
```

7. HTTP PUT request (DM to DMS) – see example in table A.8.4-7

The DM wishes to modify the earlier stored MIME object by replacing the picture X with a new picture X with new content. To modify the object the DM generates an HTTP PUT request using the same request URI as has been used for the modified (old) object. The new object is conveyed in the body of the request.

Table A.8.4-7: HTTP PUT request (DM to DMS)

```
PUT http://operator.example.com/services/users/bill/pictureX HTTP/1.1
User-Agent: IMS subscriber
Referer: http://oper.home1.net:1234/service
Date: Thu, 08 Jan 2004 11:13:17 GMT
Content-Type: image/jpeg
Content-Length: (...)
{pictureX.jpg}
```

8. HTTP 200 (OK) response (DMS to DM) – see example in table A.8.4-8

After the DMS has performed the necessary authorisation checks on the originator to ensure the DM is allowed to replace the existing MIME object with the new one the DMS sends an HTTP 200 (OK) response to the DM.

Table A.8.4-8: HTTP 200 (OK) response (DMS to DM)

```
HTTP/1.1 200 OK
Server: Apache/1.3.22 (Unix) mod_perl/1.27
Date: Thu, 08 Jan 2004 11:50:35 GMT
Content-Length: 0
```

9. XCAP PUT request (DM to DMS) – see example in table A.8.4-9

The DM wishes to remove the MIME object from his presence information. The DM generates an XCAP PUT request to modify the XML encoded presence document to remove the reference to the MIME object from the presence document. The request URI contains a node selector to the requested tuple according to draft-ietf-simple-xcap-02 [32]. Because the signalling flow does not contain the XCAP GET request the use of the If-Match header is omitted in this example.

Table A.8.4-9: XCAP PUT request (DM to DMS)

$10.XCAP\,200~(O\,K)$ response (DMS to DM) – see example in table A.8.4-10

After the DMS has performed the necessary authorisation checks, XML document validations and XML Schema compliancy checks the DMS sends an XCAP 200 (OK) response to the DM.

Table A.8.4-10: XCAP 200 (OK) response (DMS to DM)

```
HTTP/1.1 200 OK
Server: Apache/1.3.22 (Unix) mod_perl/1.27
Date: Thu, 08 Jan 2004 11:50:59 GMT
Content-Length: 0
```

11. HTTP DELETE request (DM to DMS) – see example in table A.8.4-11

The DM removes the MIME object from the DMS by generating an HTTP DELETE request

Table A.8.4-11: HTTP DELETE request (DM to DMS)

```
DELETE http://operator.example.com/services/users/bill/pictureX HTTP/1.1
Host: oper.example.com:9999
User-Agent: IMS subscriber
Date: Thu, 08 Jan 2004 11:52:00 GMT
Referer: http://oper.home1.net:1234/service
```

12. HTTP 200 (OK) response (DMS to DM) - see example in table A.8.4-12

After the DMS has performed the necessary authorisation checks on the originator to ensure that the DM is allowed to delete the object, the DMS sends an HTTP 200 (O K) response to the DM.

Table A.8.4-12: HTTP 200 (OK) response (DMS to DM)

```
HTTP/1.1 200 OK
Server: Apache/1.3.22 (Unix) mod_perl/1.27
Date: Thu, 08 Jan 2004 11:52:35 GMT
Content-Length: 0

Annex B: Bibliography

The following documents constitute essential reading for the understanding of the presence capabilities, and their provision by SIP. Unless additionally included in clause 2 of this specification, they do not constitute provisions for the support of presence by SIP in the IM CN subsystem, or of the related technical specifications 3GPP TS 23.218, 3GPP TS 24.229.

Editor's Note: The material in this Annex will not be included in TS 23.218, TS 24.228 or TS 24.229.

Editor's Note: IETF drafts included in this annex are not being tracked as part of the IETF 3GPP coordination process as until they appear as a normative reference in another document, 3GPP is not dependent on them.

	them.
[B1]	IETF RFC 2778 (February 2000): "A Model for Presence and Instant Messaging".
[B2]	IETF RFC 2779 (February 2000): "Instant Messaging / Presence Protocol Requirements".
[B3]	IETF RFC 3261 (June 2002): "SIP: Session Initiation Protocol".

[B25]	"Common Profile: Instant Messaging", D. Crocker et al., Internet-Draft in IMPP WG, http://www.ietf.org/internet-drafts/draft-ietf-impp-im-02.txt, February 2003.
[B26]	"Address Resolution for Instant Messaging and Presence", D. Crocker et al., Internet-Draft in IMPP W G, http://www.ietf.org/internet-drafts/draft-ietf-impp-srv-02.txt, February 2003.
[B27]	"The Extensible Markup Language (XML) Configuration Access Protocol (XCAP)", J. Rosenberg, Internet-Draft in SIMPLE WG, http://www.ietf.org/internet-drafts/ draft-ietf-simple-xcap-02.txt, February 2004.
[B28]	"A Session Initiation Protocol (SIP) Event Package for Modification Events for the Extensible Markup Language (XML) Configuration Access Protocol (XCAP) Managed Documents", J. Rosenberg, Internet-Draft in SIMPLE WG, http://www.ietf.org/internet-drafts/draft-ietf-simple-xcap-package-00.txt, June 2003.
[B29]	"An Extensible Markup Language (XML) Format for Representing Resource Lists", J. Rosenberg, Internet-Draft in SIMPLE WG, http://www.ietf.org/internet-drafts/draft-ietf-simple-xcap-list-usage-02.txt, February 2004.
[B30]	"Extensible Markup Language (XML) Configuration Access Protocol (XCAP) Usages for Setting Presence Authorization", J. Rosenberg, Internet-Draft in SIMPLEWG, http://www.ietf.org/internet-drafts/draft-ietf-simple-xcap-auth-usage-00.txt, June 2003.
[B31]	"Requirements for Efficient Delivery of Presence Information", M. Lonnfors et al., Internet-Draft in SIMPLE W G, http://www.ietf.org/internet-drafts/draft-ietf-simple-presinfo-deliv-reg-01.txt, October 2003.
[B32]	"Partial Notification of Presence Information", M. Lonnfors et al., Internet-Draft in SIMPLE WG, http://www.ietf.org/internet-drafts/draft-ietf-simple-partial-notify-01.txt, January 2004.
[B33]	"Requirements for Limiting the Rate of Event Notifications", A. Niemi, Internet-Draft in SIMPLE WG, http://www.ietf.org/internet-drafts/draft-niemi-sipping-event-throttle-reqs-02.txt, June 2003.
[B34]	"Presence Information Data format (PIDF) Extension for Partial Presence", M. Lonnfors et al., Internet-Draft in SIMPLE WG, draft-ietf-simple-partial-pidf-format-00.txt, January 2004.

Annex C: Change history

Data	TCC #	TSG Doc.	CD	Rev	Change history Subject/Comment	OI4	Mour
Date	TSG #	N1-021189	CR	Rev	Version 0.0.0 Editor's 1 st draft to CN1	Old	New
		N1-021169			Version 0.0.1 Input version to CN1 #25, identical to previous		+
		141 021377			version but with rebuilt table of contents.		
		N1-021921			Version 0.1.0 replaced by N1-021822 and N1-021823 at CN1 #26.		
					Version incorporates contents from N1-021580 and N1-021630.		
02/10/02		N1-022195			Version 0.2.0 produced as a result of CN1 #26 and incorporating		
					agreements from: N1-021923, N1-022130, N1-022132, N1-022133,		
					N1-022134, N1-022135, N1-022136, N1-022139, N1-022140, N1-		
					022141, N1-022158, N1-022161		
					In addition to the changes resulting from these CRs, the title was amended to accord with that in the MCC database.		
24/10/02		N1-022252			Version 0.3.0 produced as a result of CN1 #26bis and incorporating		
24/10/02		141-022232			agreements from: N1-022175, N1-022178, N1-022185, N1-022193,		
					N1-022205, N1-022207, N1-022208, N1-022209, N1-022210, N1-		
					022211, N1-022217, N1-022218, N1-022223, N1-022225.		
16/11/02		N1-030010			Version 0.4.0 produced as a result of CN1 #27 and incorporating		
					agreements from: N1-022283, N1-022284, N1-022285, N1-022286,		
40/00/00		NI4 000000			N1-0222287, N1-022288, N1-022289, N1-022349, N1-022478.		
18/02/03		N1-030362			Version 0.5.0 produced as a result of CN1 #28 and incorporating		
					agreements from: N1-030110, N1-030237, N1-030272, N1-030273, N1-030274. Revision to new document template.		
07/04/03		N1-030762			Version 0.6.0 produced as a result of CN1 #29 and incorporating		
31,3-700		11. 000702			agreements from: N1-030381, N1-030384, N1-030419, N1-030448,		
					N1-030450, N1-030525, N1-030526, N1-030529, N1-030530, N1-		
					030531, N1-030532, N1-030533.		
29/05/03		NP-031162			Version 1.0.0 produced as a result of CN1#30 and incorporating		
					agreements from: N1-030764, N1-030791, N1-030793, N1-030796,		
40/00/00		NII OO			N1-030799, N1-030900, N1-030901, N1-030902, N1-030903		
12/09/03		N1-03aaaa			Version 1.1.0 produced as a result of CN1#31 and incorporating agreements from: N1-030983, N1-031146, N1-031253, N1-031254,		
					N1-031255, N1-031277, N1-031278, N1-031279. Note that this		
					version does not include the changes resulting from N1-031316, in		
					order to allow a revision history to be maintained.		
23/09/03		N1-031363			Version 1.1.1 produced to correct implementation errors in version		
					1.1.0. Note that this version does not include the changes resulting		
					from N1-031316, in order to allow a revision history to be		
23/09/03		N1-031364			maintained. Version 1.1.2 produced to implement N1-031316 from CN1#31,		
23/09/03		141-031304			and therefore to complete the changes made at that meeting. This		
					CR restructures 3GPP TR 24.841.		
05/11/03		N1-040038			Version 1.2.0 produced as a result of CN1#32 and incorporating		
					agreements from: N1-031368, N1-031395, N1-031434, N1-031435,		
					N1-031438, N1-031661, N1-031662, N1-031663.		
29/01/04		N1-040274			Version 1.3.0 produced as a result of CN1#32bis and incorporating		
					agreements from: N1-040044, N1-040045, N1-040046, N1-040047,		
					N1-040139, N1-040064, N1-040140, N1-040144, N1-040178, N1-040179, N1-040181, N1-040182, N1-040183, N1-040186, N1-		
					040187.		
24/02/04					Version 1.4.0 produced as a result of CN1#33 and incorporating		
					agreements from: N1-040278, N1-040416, N1-040417, N1-040418.		
01/03/04					Version 1.4.1 produced to remove editor's note relating to draft-		
					isomaki-simple-xcap-pidf-manipulation-usage.		
17/03/04		N1-040647			Version 1.4.2 produced to implement missed CRs from CN1#33:		
00/04/04		NIA O A			N1-040323, N1-040476 and N1-040485.		
03/04/04		N1-04xxxx			Version 1.5.0 produced as a result of CN1 #33bis and incorporating agreements from: N1-040547, N1-040548, N1-040555, N1-040556,		
					N1-040557, N1-040585, N1-040618, N1-040622, N1-040651, N1-		
					040660, N1-040661, N1-040663, N1-040664, N1-040665, N1-		
					040666, N1-040667, N1-040668, N1-040669, N1-040671, N1-		
	<u> </u>				040672, N1-040736.		<u></u>
22/04/04		N1-040762			Version 1.5.1 produced to provide implementation of missed item in		
					N1-040666 in subclause 6.3.2.3. Additionally an editor's note in		
2004-05	CN1#34	NP-04xxxx			6.3.1.1 is corrected.		1
∠004-05	GN1#34	INF-U4XXXX			version 1.6.0. Revised to include agreements made in N1-040794, N1-040795, N1-040866, N1-040939, N1-040945, N1-040946, N1-		
				i	0-0/33. NI-0+0000. NI-040333. NI-040343. NI-040340. NI-		i

				041006, N1-041008, N1-041067, N1-041092, N1-041093.		
2004-05	CN1#34	NP-040199		version 2.0.0 identical to version 1.6.0 for presentation for approval to plenary.		
2004-06	TSGN#24	NP-040199		Approved in CN#24 plenary, and shall only remain as a Rel-6 specification.	2.0.0	6.0.0
